PT understanding or treating genetic disease, comprises detecting tandem
PT repeats in a target coding sequence and scoring the repeats for
PT polymorphic probability.
XX
PS Example; Col 483; 588pp; English.
XX

CC The invention discloses a method for identifying a candidate polymorphic
CC repeat within a coding sequence (expressed sequence tag, EST), which
CC comprises detecting tandem repeats in a target coding sequence, scoring
CC the repeats for polymorphic probability and generating a dataset
CC correlating the repeats with polymorphic probability to identify a
CC candidate polymorphic repeat. The computational methods (polymorphic
CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC useful for identifying and detecting candidate polymorphic repeats in
CC human genes, which can be used to understand, treat or eliminate genetic
CC diseases, predispositions or adverse drug-treatment reactions. Examples
CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC the polymorphic repeats identified for a search of human ESTs

CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

PT   New zinc finger-containing proteins and nucleic acids, useful in
PT   manufacturing a medicament for treating or preventing a disorder
PT   associated with decreased or increased expression or activity of MDZ3,
PT   MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS   Example 8; SEQ ID NO 5258; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT Examining allergic diseases, such as atopic dermatitis, comprises
PT comparing the expression levels of gene B1799 in T cells in a patient and
PT a healthy individual.
XX
PS Example 1; SEQ ID NO 5; 87pp; Japanese.
XX
CC This invention relates to a novel method for screening and examining
CC allergic diseases by the use of B1799 as the indicator gene.
CC Specifically, it comprises determining the expression level of this
CC indicator gene in a biological sample obtained from the patient, and
CC identifying differential expression (increased expression of B1799) in
CC comparison to that observed in a healthy individual. The present
CC invention describes the B1799 protein as antiallergic, antiinflammatory
CC and dermatological. As such, through the use of gene therapy, this method
CC can be used to treat allergic diseases particularly atopic dermatitis.
CC Furthermore, it is useful for determining a diagnosis that is convenient
CC and non-invasive, and is also applicable in high throughput screening to
CC identify candidate compounds for additional remedies. This
CC oligonucleotide sequence is the DNA oligo (SeqID 5) related to the human
CC B1799 gene of the invention.

PT genes.
XX
PS Disclosure; Fig 1; 67pp; English.
XX
CC The present invention relates to a method for providing a profile of mRNA
CC molecules present in a sample. The method comprises generating two
CC independent patterns characteristic of the population of mRNA molecules
CC expressed in the sample and analysing the patterns using a combinatorial
CC algorithm, comparing gene expression by different or same cell types
CC under different conditions, and identifying genes having a role in
CC various cellular processes. The method is useful for the analysis and
CC identification of transcribed genes, and fingerprinting. The method can
CC be used to identify genes which play a role in determining various
CC cellular processes, including susceptibility to external factors,
CC development, and disease. The present sequence for a PCR primer is used
CC in the production of a single pattern characteristic of a sample,
CC employing a Type II restriction enzyme (i.e. HaeII) in the methods of the
CC present invention

PT Determining polyadenylation sites within transcribed gene sequences
PT present in a sample comprises assigning to gene fragments gene candidates
PT within a database by comparing signals in the dataset with the database.
XX
PS Example; Fig 2; 81pp; English.
XX
CC The invention relates to determining the presence of and/or identifying a
CC polyadenylation site within a sequence of a transcribed gene or variants
CC present in a sample. The method involves assigning to gene fragments gene
CC candidates within a database by comparing signals in the dataset with the
CC database, the database comprising data representing mRNAs with known
CC polyA sites and/or 'virtual genes' representing a possible
CC polyadenylation site within an actual gene. The method is useful for
CC determining the presence of and/or identifying a polyadenylation site or
CC alternative polyadenylation sites within a sequence of a transcribed gene
CC or sequences of transcribed gene variants present or potentially present
CC in a sample, in identifying gene features, particularly in identifying
CC differences between sequence variants that occur in a population of
CC nucleic acid molecules, especially in identifying or discovering polyA
CC site usage or determining polyA site usage in a nucleic acid sample, and
CC gene variants arising from alternative polyA sites. The present sequence
CC represents a double stranded product DNA fragment

PT   Producing binary sequence tags, useful for analyzing nucleic acid
PT   sequence tags, gene expression or gene-expression patterns, involves
PT   generating nucleic acid fragments, which are mixed with offset adaptors
PT   and adaptor-indexers.
XX
PS   Disclosure; Page 100; 101pp; English.
XX
CC   The present invention describes a method of producing binary sequence
CC   tags from nucleic acid fragments in a sample, involving incubating the
CC   sample with cleaving reagents, mixing offset adaptors with the sample,
CC   incubating with more cleaving reagents and mixing the sample with adaptor
CC   -indexers where the adaptors are coupled to binary sequence tags. The
CC   method is useful in sequence analysis, including analysis and comparison
CC   of gene expression, nucleic acid samples and genomes

PT Recombinant vaccinia virus containing fusion HIB gag gene - for
PT production in host cells of gag protein for use as vaccine.
XX
PS Example 1; Page 64; 84pp; Japanese.
XX
CC AAV35388-V35414 are primers used in a method which results in a
CC recombinant vaccinia virus comprising of a gag gene from a retrovirus
CC such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope
CC region (30-300 bases in length) of a retroviral gene other than the gag
CC gene. The gag gene may be altered so as to produce a gag protein modified
CC from the natural sequence by the addition, deletion or substitution of at
CC least 1 amino acid residue. The fusion gene is inserted into a region of
CC a vaccinia virus not essential to its propagation, to give a recombinant
CC vaccinia virus vector which is used to transform a host cell (such as
CC HeLa, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon
CC culturing the host cell produces particulate structures containing the
CC fusion gag protein. The recombinant vaccinia virus or the fusion gag
CC protein particles may be used in the production of vaccines for
CC protecting against infection with retroviruses such as HIV

PT   Functionalized nanocrystal carrying polynucleotide, used for detecting
PT   target analyte, forms dendrimers with complementary nanocrystals to
PT   amplify the fluorescent signal.
XX
PS   Example 3; Page 68; 72pp; English.
XX
CC   The present invention relates to functionalised nanocrystals for use in
CC   nonisotopic detection systems for biomolecules e.g. nucleic acids,
CC   proteins, lipids or drugs. The nanocrystals have polynucleotide strands
CC   attached to their surfaces with one end of the polynucleotide extending
CC   outwardly from the nanocrystal. The present sequence is one such
CC   polynucleotide. These nanocrystals are used with a second series of
CC   nanocrystals, which have polynucleotides complementary to the first
CC   polynucleotides, so that the respective complementary strands hybridise
CC   to each other and form a dendrimer. This dendrimer produces a signal
CC   which can then be detected e.g. fluorescence. The present sequence is
CC   composed mainly of Adenine bases. This sequence may therefore be used
CC   with a polynucleotide composed mainly of Thymine bases (AAA58386)

XX
PT New pyridylpyrimidine derivatives useful in the treatment or prevention
PT of infectious disease e.g. Kuru syndrome and Creutzfeld-Jacob disease
PT (CJD).
XX
PS Example; Page 38; 96pp; English.
XX
CC The invention relates to novel pyridylpyrimidine derivatives and methods
CC of detecting prion infections and/or prion disease in an individual or in
CC cells, cell cultures and/or cell lysates. The method involves adding at
CC least one monoclonal or polyclonal antibody, oligonucleotide or pyridyl-
CC pyrimidine derivative to the sample or in cells, cell cultures and/or
CC cell lysates and detecting the activity of at least one human cellular
CC protein kinases (e.g., FGF-R1 (also known as flg, Fl-1, Flt-2, b-FGFR),
CC Tkt (also known as CCK-2, DDR-2 or EDDR; EC number 2.7.1.112), Abl (also
CC known as c-abl), clk1, MKK7 (also known as SAPK1a, SAPKalpha), CDC2 (also
CC known as CDK1), PRK), human cellular protein phosphatases such as PTP-SL
CC (also known as MCP83) and PTP-zeta, the cellular signal transduction
CC molecules HSP80 and GPIR-1. The invention is useful for regulating the
CC production of prions in cells and in the manufacture of pharmaceutical
CC composition for prophylaxis and/or treatment of infectious disease (e.g.
CC Scrapie, chronic wasting disease (CWD), transmissible mink encephalopathy
CC (TME), Creutzfeldt-Jacob disease (CJD), bovine spongiform encephalopathy
CC (BSE), variant CJD, Gerstmann-Straussler-Scheinker syndrome (GSS), fatal
CC familial insomnia (FFI), Kuru and Alpers syndrome, especially BSE, CJD,
CC vCJD) or neurodegenerative diseases (e.g., Alzheimer's disease) in humans
CC or ruminants. The present DNA sequence is a primer used to prepare
CC radioactively labelled cDNA probes from RNA. This sequence is used in the
CC exemplification of the invention

PS Disclosure; SEQ ID NO 4729; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX
PT   Efficient sequencing of long DNA by fragment walking - with simultaneous
PT   sequencing of restriction enzyme fragment and adjacent region of intact
PT   DNA, avoids the need for cloning and requires fewer primers.
XX
PS   Example 1; Page 23; 50pp; English.
XX
CC   A method for DNA analysis based on a complementary extension reaction
CC   using a DNA polymerase, comprises a combination of fragment walking and
CC   DNA sequencing. DNA fragments are formed by digestion of DNA with a
CC   restriction enzyme and the targeted DNA sequence can be determined
CC   directly from the digested DNA fragments. By exploring the overlapping
CC   sequence of the determined base sequence, the overall base sequence of a
CC   lengthy DNA can be determined with low redundancy without cloning or
CC   subcloning. In addition, the method can be done with commercially
CC   available universal primers or with fewer primers than required in
CC   existing methods. AAT73291-92 are primers used in determination of the
CC   pUC19 sequence. Primer extension was carried out using 16 primers

XX
CC   AAX91991-X97517 represent PCR primers used to amplify open reading frames
CC   and other nucleic acid sequences from the genome of Chlamydia pneumoniae
CC   (see AAX91990). C. pneumoniae causes respiratory disease such as
CC   pneumonia and bronchitis and is thought to be a contributing factor in
CC   heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema
CC   nodosum or pharyngitis. The polypeptides encoded by the open reading
CC   frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used
CC   in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
CC   nucleotides sequences can also be used as immunogenic compositions,
CC   especially where the vector directs the expression of a neutralising
CC   epitope of C. pneumoniae

PT   Selecting optimal subsequence antisense targets for inhibition of mRNA
PT   expression of target mRNA for the therapeutic treatment of genetic
PT   disease.
XX
PS   Example 2; Page 17; 87pp; English.
XX
CC   The invention relates to a method for selecting optimal subsequence
CC   antisense targets. The method involves preparing an antisense
CC   oligonucleotide capable of inhibiting mRNA expression of target mRNA
CC   sequences, as well as antisense oligonucleotides capable of binding DNA.
CC   The antisense and antigene libraries are useful for preparing therapeutic
CC   agents for the treatment of genetic disease. The present DNA sequence is
CC   human C-Raf protein target DNA related to the invention. Note: The
CC   present sequence is shown as DNA in the specification; however, in vivo,
CC   this target sequence would be mRNA

PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 5115; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 4256; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Analysis of DNA fragment - comprises addition of known common
PT   oligonucleotide, amplification of resultant DNA fragment and analysis and
PT   labelling of amplified DNA.
XX
PS   Example 1; Page 12; 17pp; Japanese.
XX
CC   This invention descibes a novel method for the analysis of a DNA fragment
CC   which comprises: (i) addition of a known common oligonucleotide sequence
CC   to at least one terminal of each DNA fragment, (ii) amplification of the
CC   resultant DNA fragment as a primer using a first common primer containing
CC   a complementary nucleotide sequence to the above mentioned known common
CC   oligonucleotide sequence, a second common primer containing a
CC   complementary nucleotide sequence to the prepared known common
CC   oligonucleotide sequence optionally having been introduced with
CC   complementary nucleotide sequence at a terminal, and a specific primer
CC   capable of hybridisation with a DNA fragment containing whole or part of
CC   the gene having known sequence, to give amplified DNA, (iii) analysis of
CC   the amplified DNA to find the information of the DNA fragment, in which
CC   the specific primer is designed to prepare fragments of the common first
CC   and second primers and to give short fragment of amplified DNA and (iv)
CC   labelling them to make their differentiation. Differentiation of
CC   informations of known and unknown genes readily provides information of
CC   unknown gene and simultaneous monitoring of signals derived from minor
CC   genes. Furthermore, labelling of DNAs according to functions of known
CC   genes can be performed. AAZ09189-Z09201 represent oligonucleotide primers
CC   used to illustrate the method of the invention

XX
PS Example 3; Page 62; 62pp; English.
XX
CC The present sequence is that of a perfectly matched target sequence for a
CC molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC a nanoparticle. In the native state, the probe forms a hairpin
CC conformation with hybridised termini. The proximity of the fluorophore
CC and quencher (gold nanoparticle) in the molecular beacon results in
CC little or no detectable fluorescence. Upon hybridisation of the central
CC complementary stretch of the probe to a target sequence, such as the
CC present sequence, the hairpin undergoes a conformational change resulting
CC in an increase in fluorescence, the extent of which is proportional to
CC the amount of target sequence present. Single mismatches can be detected.
CC The invention relates generally to the use of metal surface quenchers
CC such as particles or films for high sensitivity applications in, for
CC example, detection and diagnostic systems

PT Isolated nucleic acid molecules having polymorphisms in known human genes
PT e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT for locating, identifying and characterizing the genes responsible for
PT disorder-related traits.
XX
PS Example 6; Page 109; 714pp; English.
XX
CC This invention relates to the sequence of an isolated nucleic acid
CC molecule comprising at least one base variation from that of a known
CC human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC The polymorphisms in the human genes cited in the invention are useful as
CC genetic linkage markers for locating and characterising the genes that
CC are responsible for specific traits within the genome and eventually
CC identifying the genes responsible for a variety of disorder-related
CC traits as a result of their e.g., overexpression, constitutive
CC expression, mutation or underexpression, which may be used in diagnosing
CC and/or treating the disorders. The nucleic acid molecules comprising the
CC polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC used to screen for altered cardiovascular function, in COX2 for altered
CC susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC nervous system function, in FLAP and HNMT for altered pulmonary,
CC immunological or haematological function, in KLK2 for altered serine
CC protease activity in the prostate, in LTF for altered immunological or
CC haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC peripheral nervous system function. The present sequence represents a PCR
CC primer used to amplify the sequences of the invention

XX
CC   AAT33701-T33703 represent amplification primers used in the reverse-
CC   transcription of tissue or cell derived mRNA, in the method of the
CC   invention. The method of the invention is a molecular indexing method,
CC   and comprises digesting the cDNA amplified by these sequences with a
CC   class IIS restriction enzyme. Each resultant cDNA fragment is then
CC   ligated to a biotinylated adaptor (selected from a pool of 64 adaptors
CC   cohesive to all possible overhangs), and digesting the products with two
CC   further class IIS restriction enzymes. These steps are repeated (but the
CC   enzyme used for the first step is different in each) to produce two
CC   further cDNA samples. The ligation samples are then recovered using
CC   streptavidin-coated paramagnetic beads, removing the strand complementary
CC   to an adaptor-primer. The adaptor primer and an anchored oligo-dT primer
CC   (such as this sequence) are then used to amplify the cDNA samples. The
CC   amplified products are separated, and the sizes of the fragments obtained
CC   is recorded. The method can be used for the analysis and diagnosis or
CC   diseases such as cancers or viral infections, for the search and
CC   isolation of the genes of physiologically active substances that are
CC   potential pharmaceuticals, or causative genes of hereditary diseases, as
CC   well as for the isolation of genes for improving agricultural products.
CC   Using this method, it is possible to classify (index) DNA into groups in
CC   a short period of time without duplication

XX
PS   Claim 3; Page 14; 20pp; English.
XX
CC   AAT33701-T33703 represent amplification primers used in the reverse-
CC   transcription of tissue or cell derived mRNA, in the method of the
CC   invention. The method of the invention is a molecular indexing method,
CC   and comprises digesting the cDNA amplified by these sequences with a
CC   class IIS restriction enzyme. Each resultant cDNA fragment is then
CC   ligated to a biotinylated adaptor (selected from a pool of 64 adaptors
CC   cohesive to all possible overhangs), and digesting the products with two
CC   further class IIS restriction enzymes. These steps are repeated (but the
CC   enzyme used for the first step is different in each) to produce two
CC   further cDNA samples. The ligation samples are then recovered using
CC   streptavidin-coated paramagnetic beads, removing the strand complementary
CC   to an adaptor-primer. The adaptor primer and an anchored oligo-dT primer
CC   (such as this sequence) are then used to amplify the cDNA samples. The
CC   amplified products are separated, and the sizes of the fragments obtained
CC   is recorded. The method can be used for the analysis and diagnosis or
CC   diseases such as cancers or viral infections, for the search and
CC   isolation of the genes of physiologically active substances that are
CC   potential pharmaceuticals, or causative genes of hereditary diseases, as
CC   well as for the isolation of genes for improving agricultural products.
CC   Using this method, it is possible to classify (index) DNA into groups in
CC   a short period of time without duplication

XX
PS   Example 3; Page 48; 73pp; English.
XX
CC   The present sequence represents a primer used for reverse transcription
CC   of mRNA to produce cDNA. The cDNA is used for cDNA library production, in
CC   the course of the invention. The specification describes a method of
CC   determining differential display of gene expression, by comparison of
CC   mono-length cRNA libraries. These libraries are probe hybridised to
CC   accessible ordered arrays to determine differential hybridisation display
CC   sites between mono-length segment libraries and to locate genes of
CC   expression differential. The methods are useful for determining
CC   differential hybridisation display sites between mono-length segment
CC   libraries and to locate genes of expression differential. The methods are
CC   also useful in gene identification related to complex traits. The methods
CC   also permit monitoring drug responses at the gene expression level and
CC   locating genes involved in a particular response. The methods are also
CC   useful for pharmacogenomic research in evaluating how variability in
CC   genetic background influences positive or negative response to a drug

PT   Gamma-cop 13 polypeptide and encoded polynucleotide, used in diagnosis
PT   and treatment of malignant tumors, hemopathy, human immunodeficiency
PT   virus infection, immunological diseases and inflammation.
XX
PS   Example 2; Page 11; 33pp; Chinese.
XX
CC   The invention relates to an isolated polypeptide (I), of gamma-COP13 and
CC   the polynucleotide (II) encoding it. (I) and (II) are used in diagnosis
CC   and treatment of malignant tumour, haemopathy, human immunodeficiency
CC   virus (HIV) infection, immunological diseases and various inflammations.
CC   The present sequence represents a reverse transcriptase (RT)-PCR primer
CC   used to isolate the coding sequence of gamma-COP13 polypeptide

PT   New chemokine ST38.2 with chemotactic and leucocyte-activating properties
PT   - used to treat inflammation and immune responses and to identify
PT   specific modulators.
XX
PS   Example 3; Page 28; 64pp; English.
XX
CC   PCR primers AAV82670-71 were used to amplify cDNA encoding a novel rat
CC   chemokine designated ST38.2. In addition, primer AAV82670 was used to
CC   reverse transcribe rat RNA. The protein has chemotactic and leucocyte-
CC   activating properties. ST38.2 is involved in inflammation and immune
CC   responses, particularly inflammatory response to brain injury (trauma,
CC   ischaemia or autoimmune inflammation) but also in multiple sclerosis,
CC   stroke, rheumatoid arthritis and infections (particularly meningitis and
CC   encephalitis)

PT   modulators of voltage-gated channel activity useful for treating central
PT   nervous system disorders e.g. migraines and as neuroprotective agents.
XX
PS   Example 2; Page 62; 80pp; English.
XX
CC   The present DNA sequence is the gene specific sense primer, used in a
CC   single round of 3'RACE PCR, to clone the 3'end of the human Kv6.2 gene
CC   from human whole brain tissue. This primer specifically binds to the P
CC   region of the human Kv6.2 gene. Kv6.2 DNA sequence can be used to produce
CC   specific primers or probes for detection purposes. Modulator compounds
CC   that can modulate the ion flux through heteromeric voltage-gated
CC   potassium channels, are used as neuroprotective agents and for treating
CC   CNS disorders, such as migraines, hearing and vision problems, psychotic
CC   disorders and seizures. Kv6.2 can also be used as reporter molecules in
CC   assays and to produce antibodies

PT Conducting a bi-directional polymerase chain reaction amplification of
PT specific alleles, involves amplifying DNA containing one or both of two
PT alleles using an outer pair of primers and an inner pair of primers.
XX
PS Example; Col 7-8; 22pp; English.
XX
CC The present sequence is that of human Factor V (FV) gene primer A11
CC F5(253)-24D, used in bi-directional PCR amplification of specific alleles

CC (Bi-PASA). Its name indicates an A primer for FV (F5), the 5' end
CC beginning at base 253 of exon 10 of the FV gene (see AAF30549) and
CC proceeding downstream for 24 bases. It also includes a G8C2 tail, and the
CC first base from the 3' end is a mutated A nucleotide. A mutation in FV
CC gene exon 10 is associated with venous thromboembolism. Detection of this
CC mutation was used to demonstrate Bi-PASA. In Bi-PASA, 2 outer primers (P
CC and Q) and 2 inner primers (A and B) are used. A and B are each specific
CC for different alleles. P is complementary to the antisense strand of both
CC alleles in a region upstream of the sequence difference (mismatch). Q is
CC complementary to the sense strand of both alleles in a region downstream
CC of the mismatch. In heterozygotes, 3 segments are amplified: a segment of
CC size AQ resulting from 1 allele, another of size PB resulting from the
CC 2nd allele, and a combined segment of size PQ. In homozygotes, segment PQ
CC and either segments AQ or PB amplify. P, Q, A and B primers for the FV
CC gene are given in AAF30550-74. Under optimal PCR conditions, the relative
CC yield of DNA products obtained using the present primer is good, as
CC indicated by a very strong DNA band on agarose gels. Bi-PASA provides a
CC one-tube method for simultaneously differentiating homozygotes and
CC heterozygotes. It can detect small deletions and insertions as well as
CC single base changes. Bi-PASA is also used to perform population
CC screening, haplotype analysis, patient screening and carrier testing. The
CC method is rapid, reproducible, inexpensive, non-isotopic and amenable to
CC automation

XX
CC   The invention relates to purified, isolated caspase-12 polypeptides and
CC   their polynucleotides. Cysteine-dependent aspartate-specific proteases
CC   (caspases) are a family of proteases that cleave their substrates at
CC   aspartic acid-X bonds. They are highly specific endopeptidases that
CC   catalyse limited proteolysis. Caspase-12 polypeptides are useful for
CC   screening modulators of caspase activity. Caspase12 inhibitors are useful
CC   for preventing or treating disorders involving inappropriate apoptosis,
CC   cardiovascular diseases, neurodegenerative disorders (Alzheimer's disease
CC   Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis
CC   (ALS)); inflammatory diseases (systemic inflammatory conditions and
CC   conditions associated locally with migration and attraction of monocytes,
CC   leukocytes and/or neutrophils); autoimmune diseases (rheumatoid or
CC   reactive arthritis, acute glomerulonephritis, chronic glomerulonephritis,
CC   inflammatory bowel diseases such as Crohn's disease, ulcerative colitis
CC   and necrotising enterocolitis); allergic reactions (allergic asthma,
CC   chronic bronchitis, acute and delayed hypersensitivity, allergic rhinitis
CC   and cell proliferative disorder (cancer). Cancers that may be treated
CC   comprise lymphomas, carcinomas or hormone-dependent tumours. The present
CC   sequence is a PCR primer used for amplifying human caspase-12 cDNA 5'
CC   clones

PT New PN9826 polypeptide and nucleic acid encoding the polypeptide, useful
PT in screening assays to select modulators of PN9826 for treating or
PT preventing diseases or disorders such as cancer, diabetes, Alzheimer's
PT disease or asthma.
XX
PS Claim 1; Page 66; 69pp; English.
XX
CC The invention relates to a new isolated PN9826 polypeptide (a latent
CC transforming growth factor beta binding protein 1, LTBP1) or its fragment
CC appearing as ABU62815-ABU62833 or an amino acid sequence that is at least
CC 95% identical to the sequences above and capable of interacting with
CC LTBP1. Also included are the nucleic acids encoding the LTBP1 proteins, a
CC nucleic acid vector comprising the isolated PN9826 nucleic acid, a host
CC cell containing the nucleic acid vector, a microarray comprising the
CC isolated PN9826 nucleic acid and an isolated antibody immunoreactive with
CC an LTBP1 polypeptide appearing as ABU2819-ABU2821. The PN9826 nucleic
CC acids and proteins are useful in screening assays to select modulators of
CC PN9826 and the protein complexes formed by PN9826 and latent transforming
CC growth factor beta binding protein 1 (LTBP1). The modulators are useful
CC in modulating the functions and activities of PN9826 and protein
CC complexes containing PN9826, e.g. angiogenesis, metastasis, or cell
CC growth and adhesion. The proteins and protein-protein interactions in
CC which they participate are potential drug targets useful in identifying
CC new drugs for treating or preventing diseases or disorders such as
CC cancer, diabetes, Alzheimer's disease, asthma, atherosclerosis,
CC infectious diseases (e.g. hepatitis or pneumonia), hypertension,
CC inflammatory disorders, obesity, tissue ischaemia (e.g. coronary artery
CC disease), peripheral vascular disease, neurodegenerative disorders, or
CC impaired wound healing. Detecting PN9826 nucleic acid, polypeptide and/or
CC protein complexes is useful for diagnosing the diseases mentioned above.
CC The present sequence encodes a PN9826 fragment

PT Identifying a compound that modulates the biological activity of a native
PT quadruplex DNA for treating colorectal cancer comprises determining the
PT presence or absence of interaction between the candidate compound and the
PT test quadruplex DNA.
XX
PS Disclosure; Fig 8A; 69pp; English.
XX
CC The present sequence is that of a quadruplex structure-forming DNA
CC sequence from the nuclease hypersensitivity element (NHE) in the
CC regulatory regions of the human RET gene. Certain mutations in quadruplex
CC forming nucleotides sequences have been shown to destabilise quadruplex
CC structure and are associated with cancer. Methods are provided for
CC identifying quadruplex nucleotide sequences having destabilising guanine
CC substitutions, for determining whether a subject is at risk of developing
CC or having cancer, pharmacogenomic methods for targeting appropriate
CC prevention or therapeutic regiments, methods for screening molecules that
CC interact with stabilised and destabilised quadruplexes, and therapeutic
CC methods for treating cancers, such as antisense nucleic acid cancer
CC therapy that specifically targets DNA in subjects having a quadruplex-
CC destabilising mutation.

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 64; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

XX
CC   The present sequence is a primer for Acacia auricaliformis. This sequence
CC   was used in RT-PCR reactions to produce cDNA from A. auricaliformis RNA.
CC   The resulting cDNA was amplified via PCR using the present sequence and
CC   another PCR primer (see AAA62141). The PCR product was used as an
CC   expression probe. The expression probe was used to obtain desired DNA
CC   fragments. The plant genetic fragments obtained by this method may be
CC   useful as markers in plant breeding. In addition, genes encoding the DNA
CC   fragments or their promoter regions may be used to modify expression.

PT   Preparing nonpathogenic infectious pancreatic necrosis virus, IPNV,
PT   useful for producing attenuated virus for vaccines useful in the
PT   aquaculture industry.
XX
PS   Example 1; Page 21; 63pp; English.
XX
CC   A method has been developed for preparing nonpathogenic, infectious
CC   pancreatic necrosis virus (IPNV). The method comprises: 1) preparing cDNA
CC   containing the IPNV genome segments A and B where A is modified to
CC   prevent expression of an arginine-rich non-structural (NS) protein; 2)
CC   transcribing the cDNA to produce RNA; 3) incubating the host cells in a
CC   culture medium; and 4) isolating live IPNV from the culture medium. The
CC   method is useful to produce live nonpathogenic IPNV, useful to study
CC   viral pathogenesis and for the production of live, nonpathogenic IPNV
CC   vaccines, since it was demonstrated that the NS protein-deficient virus
CC   could replicate but did not invoke a pathological response in hosts.
CC   Combination vaccines may also be produced by combining the IPNV with
CC   bacterial antigens (especially from gram negative bacteria e.g. Aeromonas
CC   salmonicida) and/or antigens from aquatic viruses other than Birnaviruses
CC   (the family to which IPNV belongs) e.g. infectious haematopoietic
CC   necrosis virus. The method may also be used to generate a nonpathogenic
CC   chimeric virus when the cDNA of segment A encodes epitopic determinants
CC   from at least two different IPNV strains. IPNV causes a highly contagious
CC   and destructive disease of juvenile Rainbow and Brook trout and Atlantic
CC   salmon (e.g. highly virulent strains can cause more than 90 % mortality
CC   in hatchery stocks less than 4 months old and survivors can remain
CC   lifelong carriers and reservoirs of infection); IPNV is therefore a
CC   pathogen of major economic importance to the aquaculture industry. The
CC   present sequence represents an IPNV PCR primer used in an example from
```

PT   New compositions comprising sensor arrays made up of unique probe
PT   oligonucleotides - useful for characterizing a sample of target deletion
PT   oligonucleotides.
XX
PS   Example 1; Page 98; 163pp; English.
XX
CC   This invention describes a novel composition comprising a number of
CC   sensor arrays, where each array comprises a unique probe oligonucleotide,
CC   which is the reverse complement of part of a unique target
CC   oligonucleotide present in a mixture of target deletion sequence
CC   oligonucleotides. The compositions form a method for characterizing a
CC   sample of target deletion oligonucleotides which are labelled and
CC   hybridize with the probe oligonucleotides of the sensor arrays. Such
CC   oligonucleotides and their targets are represented in AAX23548-X23709.
CC   Oligonucleotides characterized by the method form pharmaceutical
CC   compositions that are useful for modulating cellular adhesion or
CC   proliferation, and being active against a eukaryotic pathogen, a human
CC   retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC   retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC   Syncytial Virus or cytomegalovirus (CMV). The compositions enable
CC   characterization of deletion sequence oligonucleotides having related,
CC   but different nucleobase sequences, and quantification of different
CC   species of deletion sequence ("target") oligonucleotides in a mixture.
CC   Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC   its reverse complement is not modified, the method may be performed using
CC   oligodeoxynucleotides

PT   New drug delivery construct comprising a transport and active agent
PT   region, useful for the manufacture of a pharmaceutical composition for
PT   treating nerve injury.
XX
PS   Example 14; Page 86; 188pp; English.
XX
CC   The invention relates to a new drug delivery construct comprises at least
CC   one transport agent region and an active agent region. The transport
CC   agent region is able to facilitate the uptake of the active agent region
CC   into a cell. The active agent region is an active therapeutic agent
CC   region able to facilitate axon growth and an analogue. The drug delivery
CC   construct is useful for suppressing the inhibition of neuronal axon
CC   growth, facilitating axon growth, treating nerve injury, treating
CC   ischaemic damage related to stroke injury. The drug delivery construct
CC   and the drug conjugate are useful for the manufacture of a pharmaceutical
CC   composition for treating nerve injury. The invention is useful in gene
CC   therapy. The present sequence is an oligonucleotide used to clone
CC   C3Basic3 reverse HIV Tat protein

PT Calibration of molecular array data by employing calibration probes that
PT generate signals proportional to total concentrations of labeled target
PT molecules, and molecular arrays incorporating sets of calibration probes.
XX
PS Disclosure; Page 14; 32pp; English.
XX
CC The invention relates to a method for calibrating data scanned from a
CC molecular array. The method involves employing calibration probes that
CC generate signals proportional to the total concentrations of labelled
CC target molecules to which the molecular array probes are directed over an
CC entire range of sample solutions and molecular arrays incorporating sets
CC of calibration probes. Method is useful for calibrating different types
CC of signals scanned from a molecular array, or calibrating signals scanned
CC from different molecular arrays. The present sequence is poly (A)
CC normalisation probe used in calibration of molecular array data

PT Calibration of molecular array data by employing calibration probes that
PT generate signals proportional to total concentrations of labeled target
PT molecules, and molecular arrays incorporating sets of calibration probes.
XX
PS Disclosure; Page 14; 32pp; English.
XX
CC The invention relates to a method for calibrating data scanned from a
CC molecular array. The method involves employing calibration probes that
CC generate signals proportional to the total concentrations of labelled
CC target molecules to which the molecular array probes are directed over an
CC entire range of sample solutions and molecular arrays incorporating sets
CC of calibration probes. Method is useful for calibrating different types
CC of signals scanned from a molecular array, or calibrating signals scanned
CC from different molecular arrays. The present sequence is poly (A)
CC normalisation probe used in calibration of molecular array data

XX
PT Synthesizing RNA oligonucleotide involves combining single-stranded
PT circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT enzyme to yield desired RNA complementary to circular oligonucleotide
PT template.
XX

PS Example 18; SEQ ID NO 38; 78pp; English.
XX
CC The invention relates to a method for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template with at least two types of ribonucleotide
CC triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC oligonucleotide multimer complementary to the circular oligonucleotide
CC template, where the RNA oligonucleotide multimer comprises multiple
CC copies of the desired RNA oligonucleotide. The method is useful for
CC synthesising an RNA oligonucleotide with well-defined ends. The circular
CC oligonucleotide is introduced into the cell using direct injection,
CC electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC cation-mediated delivery. The method is useful for treating bacterial
CC and/or viral infections in mammals, particularly drug resistant
CC infections, and for producing double stranded DNA oligomers. The method
CC is performed in the absence of an oligonucleotide primer, or without the
CC addition of auxiliary proteins. This sequence represents an
CC oligonucleotide used in the method of the invention.

PT New short interfering nucleic acid, useful e.g. for treatment and
PT diagnosis of obesity or diabetes, downregulates expression of the
PT stearoyl-CoA desaturase gene.
XX
PS Example 3; SEQ ID NO 290; 139pp; English.
XX
CC The present invention describes a short interfering nucleic acid (siNA)
CC that downregulates expression of the SCD (stearoyl-CoA desaturase) gene
CC by RNA interference. Also described: (1) modulating expression of SCD
CC genes in cells, tissue explants or organisms by introduction of siNA; (2)
CC kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or
CC complexes of siNA; and (4) vectors that express siNA. SCD inhibiting
CC siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and
CC virucide activities. The siNAs can be used to modulate expression of SCD
CC genes, in cells, tissue explants or organisms, e.g. for treating obesity;
CC diabetes (types I and II); atherosclerosis; cancer and viral infections.
CC They can also be used for drug screening; diagnosis; target
CC identification and validation; genetic engineering; pharmacogenomics;
CC studying gene function and gene mapping (e.g. of single-nucleotide
CC polymorphisms). The present sequence represents an SCD siNA, which is
CC used in the exemplification of the present invention.

PT   Analyzing target nucleic acid sequences, useful for population genetics,
PT   drug development and diagnosing cancer, comprises hybridizing triple
PT   forming oligonucleotide and probe to target sequence.
XX
PS   Example 2; Page 66; 141pp; English.
XX
CC   The sequence is a polypyrimidine oligonucleotide for binding a second
CC   reverse phase triplex forming oligonucleotide, RP-TFO, (3' to the SNP) to
CC   the target SNP used to analyse Factor V Leiden SNP using the method of
CC   the invention. The invention relates to analysing target nucleic acid
CC   sequences comprising restricting isolated DNA, hybridising at least one
CC   triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to
CC   form a protected nucleic acid sequence (PNAS) tail structure, hybridising
CC   the captured structure with a single nucleotide polymorphisms (SNP)
CC   identification probe and determining the SNP score. The methods can be
CC   used for analysing target nucleic acid sequences, especially genomic DNA
CC   sequences, to determine if they contain SNPs or short tandem repeats
CC   (STRs). The methods can be used to detect SNPs for use in population
CC   genetics, drug development, forensics, cancer, genetic disease research,
CC   genomic analysis, diagnostics and therapeutics in humans, plants and
CC   animals

PT   New BAP28 polynucleotides and polypeptides overexpressed in prostate
PT   cancer cells for diagnosing prostate tumors, e.g. by hybridization or
PT   polymerase chain reaction assays.
XX
PS   Example; Page 347; 349pp; English.
XX
CC   The invention is directed to BAP28 polypeptides, BAP28 polynucleotide
CC   sequences and regulatory region located at the 3' and 5' ends of the
CC   BAP28 coding region. The BAP28 polypeptides can be expressed by standard
CC   recombinant methodology. BAP28 polynucleotides and polypeptides have been
CC   found to be over expressed in prostate tumour cells, therefore levels of
CC   BAP28 expression and/or activity may be assayed (e.g. by polymerase chain
CC   reaction (PCR)) to diagnose patient suffering from or susceptible to
CC   prostate cancer. Antibodies specific for the BAP28 polypeptides are
CC   useful as diagnostic reagents. Biallelic markers of the BAP28 gene are
CC   useful in genetic analysis. Sequences AAF83934-963 represent primers for
CC   the BAP28 gene and PCTA-1 gene (the coding strand of PCTA-1 gene is on
CC   the opposite of the coding strand of BAP28)

PT   Reducing immunostimulatory effects of phosphoro:thioate
PT   oligo:nucleotide(s) - comprises modifying terminal structures, e.g. by
PT   introducing methyl:phosphonate linkages or ribonucleotide(s).
XX
PS   Example 1; Page 28; 42pp; English.
XX
CC   AAT88463-T88465 are phosphorothioate linked oligonucleotides that are
CC   complementary to HIV-1 gag and pol regions and human p53 respectively.
CC   They are used as controls for an experiment for identifying
CC   phosphorothioate oligonucleotides with reduced immunostimulatory
CC   response. Such oligonucleotides can be used to treat pathogenic
CC   infections and diseases with a genetic component e.g. cancer and
CC   inherited conditions. They can be administered in a therapeutic
CC   formulation and the mammal's immune response monitored; in such a
CC   formulation the activity of the oligonucleotides may also be enhanced by
CC   the addition of other active factors and agents, and combinations of the
CC   oligonucleotides could be directed at different regions of a pathogen
CC   genome or an overexpressed target gene

PT   Use of nucleic acids containing an unmethylated CpG - for treating a
PT   subject having or at risk of having an acute decrement in air flow or
PT   inhibiting an inflammatory response.
XX
PS   Claim 35; Page 27; 65pp; English.
XX
CC   This sequence represents an unmethylated CpG dinucleotide, and can be
CC   used in the method of the invention. The method is for treating a subject
CC   having, or at risk of having an acute decrement in air flow, comprising
CC   administering a nucleic acid sequence containing at least one
CC   unmethylated CpG. The nucleic acids containing an unmethylated CpG
CC   dinucleotide affect an immune response in a subject by activating natural
CC   killer cells (NK) or redirecting a subject's immune response from a Th2
CC   to a Th1 response by inducing monocytic and other cells to produce Th1
CC   cytokines. They can be used to treat pulmonary disorders having an
CC   immunologic component, such as asthma or environmentally induced airway
CC   disease. They can also be used to treat diseases associated with Gram-
CC   positive bacterial infections or endotoxaemia including bacterial
CC   meningitis, neonatal sepsis, cystic fibrosis, inflammatory bowel disease
CC   and liver cirrhosis, Gram-negative pneumonia, Gram-negative abdominal
CC   abscess, haemorrhagic shock, disseminated intravascular coagulation, or
CC   an inflammatory response to lipopolysaccharide

XX
PT   Antisense oligonucleotides to ribonucleotide reductase genes - used to
PT   modulate tumour growth and inhibit tumour cell proliferation.
XX
PS   Claim 4; Page 38; 79pp; English.
XX
CC   AAV22429-530 represent antisense oligonucleotides which are targeted
CC   against the mRNA of the R2 subunit sequence of ribonucleotide reductase.
CC   Aberrant expression of the R2 gene can determine the malignant
CC   characteristics of cells. Altered R2 expression was found to cooperate
CC   with ras in mechanisms of malignant progression, and recombinant R2
CC   expression resulted in increased membrane associated Raf-1 protein. These
CC   results suggest that R2 cooperates with Raf-1 and Rac-1, thereby
CC   affecting ras pathways and cell proliferation. Suppression of R2 gene
CC   expression was found to reduce transformed properties of tumour cells.
CC   The antisense oligonucleotides can be used for modulating tumour cell
CC   growth, or for inhibiting tumour cell proliferation. They can also be
CC   used for increasing the sensitivity of neoplastic cells to
CC   chemotherapeutic drugs (especially to hydroxyurea, methotrexate (MTX),
CC   and PALA). The antisense oligonucleotides may be used to treat
CC   proliferative disorders including leukaemias, lymphomas, sarcomas,
CC   melanomas, various other forms of cancer, papillomas, arthrosclerosis,
CC   psoriasis, polythemia, mastocytosis, autoimmune diseases, angiogenesis,
CC   bacterial infections and viral infections (including HIV hepatitis, or

PT   Use of neutralising CpG and stimulating CpG motifs in DNA vectors - for
PT   enhancing the immunostimulatory effect of an antigen or enhancing the
PT   expression of a therapeutic polypeptide.
XX
PS   Example 1; Page 64; 109pp; English.
XX
CC   AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe a
CC   method for enhancing the immunostimulatory effect of an antigen encoded
CC   by nucleic acid contained in a nucleic acid construct. The method
CC   involves determining the CpG-N and CpG-S motifs present in the construct,
CC   removing neutralising CpG (CpG-N) motifs and optionally inserting
CC   stimulatory CpG (CpG-S) motifs in the construct, thereby producing a
CC   nucleic acid construct having enhanced immunostimulatory efficacy. The
CC   method can be used for immunisation against viral antigens, e.g. from
CC   hepatitis B virus (HBV), bacterial antigens or an antigen derived from a
CC   parasite. They can also be used for expression of a therapeutic
CC   polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines,
CC   apoptotic proteins, interferons, hormones, clotting factors, ligands and
CC   receptors. (Updated on 20-MAR-2003 to correct PA field.)

PT   Antisense oligonucleotides for treating disease states characterized by
PT   induction of p53 e.g. cancer and restenosis.
XX
PS   Claim 1; Page 20; 27pp; English.
XX
CC   The present invention describes an oligonucleotide (I) which is a
CC   morpholino oligonucleotide, a peptide nucleic acid, a 2'-O-allyl or 2'-O-
CC   alkyl modified oligonucleotide or a N3'-->P5' phosphoramidate
CC   oligonucleotide with a defined base sequence given in AAA39399 or
CC   AAA39400. Also described is a method of treating a disease state
CC   characterised by p53 induction in a mammalian subject comprising
CC   administering (I). (I) has cytostatic, antipsoriatic, vasotropic,
CC   cerebroprotective, antiinflammatory, opthalmalogical and antiasthmatic
CC   activities. The oligonucleotides are useful for treating disease states
CC   characterised by induction of p53 in a human subject where the disease
CC   state is preferably cancer or results from an ischaemic or
CC   ischaemic/reperfusive injury. Other disease states which can be treated
CC   include proliferative cell disorders e.g. restenosis, human papilloma
CC   virus (HPV)-infected cells, asthma, keratoconjunctivitis and psoriasis
CC   and hypoxic states induced by ischaemic attacks e.g. stroke or organ
CC   transplant. Morpholino oligomers and C-5-propyne pyrimidine-modified
CC   oligonucleotide are particularly effective RNA-binding molecules and
CC   distort the RNA helix which disrupts ribosomal binding

PT   New antisense compounds for modulating the expression of G-alpha-S1,
PT   especially useful for diagnostics, therapeutics and prophylaxis, e.g. to
PT   prevent or delay infection, inflammation or tumor formation.
XX
PS   Claim 3; Col 40; 37pp; English.
XX
CC   The present invention relates to antisense compounds 8-30 bases long
CC   targeted to a coding region, a stop codon, or a 3' untranslated region of
CC   human G-alpha-S1 (see AAA94451). The antisense compounds specifically
CC   hybridize with and inhibit the expression of human G-alpha-S1. The
CC   antisense compounds are useful for diagnostics, therapeutics and
CC   prophylaxis, e.g. to prevent or delay infection, inflammation or tumour
CC   formation. Particularly, the antisense oligonucleotides are useful for
CC   treating humans prone to a disease or condition associated with
CC   expression of G-alpha-S1. The present sequence an antisense
CC   oligonucleotide targeted to the 3' untranslated region of human G-alpha-

PT   Composition for treating hormone-regulated cancer, e.g. breast and
PT   prostatic tumors, comprising an antisense oligonucleotide that inhibits
PT   expression of insulin like growth factor binding protein-5 by hormone-
PT   regulated tumor cells.
XX
PS   Disclosure; Page 44; 45pp; English.
XX
CC   This sequence represents an antisense oligonucleotide targeted against
CC   human insulin-like growth factor binding protein-5 (IGFBP-5). The
CC   invention relates to a composition for treatment of hormone-regulated
CC   cancer, comprising an antisense oligonucleotide (such as this sequence)
CC   which inhibits expression of IGFBP-5 by hormone-regulated tumour cells.
CC   The compositions is useful for delaying progression of hormone-regulated
CC   tumour cells such as prostatic cancer cells or breast cancer cells, to an
CC   androgen-independent state, by treating hormone sensitive tumour cells
CC   with the antisense sequence which inhibits expression of IGFBP-5 by the
CC   tumour cells. The composition can also be used for treating a hormone-
CC   responsive cancer in an individual, and administering the composition to
CC   the individual after initiation of hormone-withdrawal to induce apoptotic
CC   cell death of hormone-responsive tumour cells, and therefore delaying the
CC   progression of hormone-responsive cancer cells to a hormone-independent
CC   state in the individual. It can also be used for inhibiting or delaying
CC   metastatic boney progression of an IGF-1 sensitive tumour in a mammal, by
CC   administering the composition to inhibit the expression of IGFBP-5 by the
CC   hormone-responsive cancer cells, and therefore inhibiting or delaying
CC   metastatic boney progression of the tumour

PT Vaccinating against tumors, infectious diseases, allergies and asthma
PT using immunostimulatory Py-rich and TG nucleic acids.
XX
PS Claim 101; Page 43; 338pp; English.
XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT   Sustained release composition for oligonucleotides, e.g. antisense
PT   oligodeoxynucleotides, contains a biocompatible polymer, and an antisense
PT   oligonucleotide complexed with a metal cation.
XX
PS   Claim 9; Col 10; 13pp; English.
XX
CC   The present invention describes a sustained release composition,
CC   comprising a biocompatible polymer, and an antisense oligonucleotide,
CC   dispersed within the biocompatible polymer, and complexed with a metal
CC   cation. The present sequence represents a specifically claimed 20-mer p53
CC   phosphorothioate antisense oligonucleotide for use in the above
CC   composition. The composition has cytostatic activity and can be used as a
CC   gene expression inhibitor. The composition can be used for the sustained
CC   release of oligonucleotides, particularly antisense oligonucleotides. The
CC   antisense oligonucleotides are useful in the treatment of diseases, where
CC   a particular protein has been identified as critical for a disease to
CC   flourish

PT   Composition for sustained release of oligonucleotide from a polymer
PT   matrix, comprises biocompatible polymer, and a metal cation-complexed
PT   oligonucleotide dispersed within the biocompatible polymer.
XX
PS   Example 1; Page 6; 13pp; English.
XX
CC   The invention relates to a new composition (I) for the sustained release
CC   of an oligonucleotide from a polymer matrix, comprising: (a) a
CC   biocompatible polymer; and (b) a metal cation-complexed oligonucleotide,
CC   dispersed within the biocompatible polymer. (I) is useful for providing a
CC   therapeutically effective amount of an oligonucleotide in a subject for a
CC   sustained period. The compositions are preferably useful for providing
CC   anti-leukaemic effects in vivo, where the antisense oligonucleotides in
CC   the composition are directed to genes involved in cellular
CC   transformation. The sustained release composition overcomes the problem
CC   of high initial release of an oligonucleotide, in particular an antisense
CC   oligodeoxynucleotide (ODN) which is not stabilised prior to incorporation
CC   into the polymeric matrix. Also, loss of activity of the oligonucleotide,
CC   such as an antisense ODN due to instability of the medicament, and
CC   chemical interactions between the oligonucleotide, and other components
CC   contained in or used in formulating the sustained release composition are
CC   substantially absent. The advantages also include increased patient
CC   compliance and acceptance by eliminating the need for repetitive
CC   administration, increased therapeutic benefit by eliminating fluctuations
CC   in oligonucleotide concentration in blood levels by providing a desirable
CC   release profile, and a potential lowering of the total amount of the
CC   oligonucleotide, in particular an antisense, ODN, necessary to provide a
CC   therapeutic benefit, by reducing these fluctuations. The present sequence
CC   represents an antisense oligonucleotide used in an example of the
CC   invention

PT   Composition for sustained release of oligonucleotide from a polymer
PT   matrix, comprises biocompatible polymer, and a metal cation-complexed
PT   oligonucleotide dispersed within the biocompatible polymer.
XX
PS   Example 1; Page 6; 13pp; English.
XX
CC   The present sequence is an anti-p53 phosphorothioate antisense
CC   oligodeoxynucleotide (ODN). This antisense ODN was used in examples of
CC   the invention examining the encapsulation and sustained release of
CC   complexed ODN. The invention relates to a composition for the sustained
CC   release of oligonucleotides, especially antisense ODNs. The composition
CC   comprises a biocompatible polymer matrix into which a metal cation-
CC   complexed oligonucleotide is dispersed. Administration of the composition
CC   provides a therapeutically effective blood level of oligonucleotide in a
CC   subject for a sustained period. This overcomes the problem of high
CC   initial release of an oligonucleotide, in particular an antisense ODN,
CC   which is not stabilised prior to encapsulation. Loss of activity of the
CC   oligonucleotide, and chemical interactions between the oligonucleotide
CC   and other components contained in, or used in, formulating the sustained
CC   release composition are substantially absent. Patient compliance and
CC   acceptance are enhanced by eliminating the need for repetitive
CC   administration, and there is increased therapeutic benefit by eliminating
CC   fluctuations in oligonucleotide concentration in blood levels

PT New antisense oligonucleotides targeted to nucleic acid encoding Protein
PT Phosphatase 2 catalytic subunit beta, useful for treating diseases
PT related to Protein Phosphatase 2 catalytic subunit beta expression, such
PT as cancer.
XX
PS Example 16; Page 98; 137pp; English.
XX
CC The invention relates to a novel compound 8-50 nucleotides in length
CC targeted to a nucleic acid molecule encoding a protein phosphatase 2
CC catalytic beta subunit, where the compound specifically hybridises with
CC and inhibits the expression of protein phosphatase 2 catalytic beta
CC subunits, or specifically hybridises with at least an 8-nucleotide
CC portion of an active site on a nucleic acid molecule encoding a protein
CC phosphatase 2 catalytic beta subunit. The antisense compounds are useful
CC for modulating the expression of protein phosphatase 2 catalytic beta
CC subunits and for treating diseases or conditions associated with
CC expression of protein phosphatase 2 catalytic beta subunits, e.g.
CC aberrant insulin regulation or diabetes or a hyperproliferative disorder,
CC particularly cancer. The antisense compounds are also useful for
CC diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay
CC infection, inflammation or tumour formation, as research reagents and
CC kits, and in distinguishing between functions of various members of a
CC biological pathway. This polynucleotide sequence represents an
CC oligonucleotide inhibitor of rat protein phosphatase 2 catalytic beta
CC subunit mRNA levels of the invention. NOTE: This oligonucleotide contains
CC phosphorothioate residues and has 2'- MOE wings with a deoxy gap

PT New nucleic acid implicated e.g. in tumor suppression, useful for
PT diagnosis of tumors, viral infection and cellular degeneration and for
PT drug screening.
XX
PS Claim 1; Page 468; 623pp; French.
XX
CC The present invention relates to novel human nucleic acid sequences (I).
CC The present sequence is one such nucleic acid sequence. Expression of (I)
CC are implicated in tumour suppression or reversion and apoptosis and viral
CC resistance. (I) are useful as probes or primers for detecting,
CC identifying, measuring and/or amplifying nucleic acid sequences, as
CC antisense reagents and for recombinant production of polypeptides. (I),
CC polypeptides (II) encoded by (I), vector containing (I), cells containing
CC these vectors and antibodies (Ab) against (II) are all useful for
CC treatment/prevention of viral, tumour and cell degeneration diseases
CC (especially neurodegeneration, such as Alzheimer's disease and
CC schizophrenia). Analysing the expression of (I) is also useful for
CC diagnosis and/or prognosis of such diseases. Transgenic animals carrying
CC (I) are used for studying the aetiology of these diseases (also immune
CC and inflammatory diseases). Note: In the present specification, SEQ ID 1
CC to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown
CC in the specification

PT Determining the clonality of a T-cell receptor (TCR) rearrangement in a
PT sample by polymerase chain reaction PCR and temporal temperature gradient
PT gel electrophoresis, useful for the diagnosis of neoplastic T-cell
PT disease.
XX
PS Disclosure; Fig 4; 31pp; English.
XX
CC The present invention describes a method (M1) for determining clonality
CC of a T cell receptor (TCR) rearrangement comprising extracting nucleic
CC acid, amplifying by PCR with two or more TCR-specific primers to provide
CC one or more TCR DNA fragments, and analysing the TCR DNA fragments using
CC an electrophoretic gel by temporal temperature gradient gel
CC electrophoresis (TTGE), where the presence of one or more discrete DNA
CC bands in the gel indicates the presence of a clonal TCR rearrangement.
CC Also described: (1) diagnosing (M2) a patient suspected of having a
CC neoplastic T-cell disease, comprising obtaining a sample from the
CC patient, and determining whether a clonal TCR gene rearrangement is
CC present in the sample by analysing the sample by (M1), where the presence
CC of the clonal TCR gene rearrangement indicates neoplastic T-cell disease;
CC (2) preparing (M3) a DNA migration marker for use in a TTGE gel,
CC comprising providing one or more TCR DNA segments having known migration
CC rates in the TTGE gel; and (3) a TTGE DNA migration marker, comprising a
CC substantially pure DNA molecule having a TCR gene sequence, and a buffer
CC suitable for loading on a TTGE gel. (M1-M3) and compositions are useful
CC for the diagnosis of neoplastic T-cell disease. The present sequence
CC represents a PCR primer used for the detection of clonal TCR-gamma
CC rearrangement, which is used in the exemplification of the present
CC invention

PT Treating non-allergic inflammatory diseases, such as psoriasis, eczema,
PT allergic contact dermatitis, latex dermatitis or inflammatory bowel
PT disease by administering an immunostimulatory nucleic acid.
XX
PS Disclosure; Page 15; 229pp; English.
XX
CC The invention describes a method of treating non-allergic inflammatory
CC disease comprising administering to a subject having or at risk of
CC developing a non-allergic inflammatory disease an immunostimulatory
CC nucleic acid for prevention or treatment of the disease. The method is
CC useful for treating non-allergic inflammatory diseases, such as
CC psoriasis, eczema, allergic contact dermatitis, latex dermatitis or
CC inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease.
CC This sequence represents an immunostimulatory nucleic acid

PT   Treating diseases with oligonucleotides or interfering RNA, useful e.g.
PT   for cancer or autoimmune diseases, covalently coupled to mobile proteins,
PT   in vivo or in vitro.
XX
PS   Claim 128; Page 12; 42pp; English.
XX
CC   The present invention describes a method for treating a disease by
CC   administering: (a) a therapeutic oligonucleotide (TON) or double-stranded
CC   RNA (dsRNA) that includes a reactive group (RG) that can react with a
CC   mobile protein (MP) to form a covalent conjugate of TON/dsRNA and MP; or
CC   (b) TON or dsRNA already conjugated to MP through a covalent bond. Also
CC   described: (1) TON of 15-30 bases that includes (i) a part that binds to
CC   target RNA or DNA and (ii) RG; (2) TON of 15-30 bases that includes a
CC   part that binds to target RNA or DNA and is conjugated to MP through a
CC   covalent link; (3) dsRNA that includes RG; and (4) dsRNA that is
CC   conjugated to MP through a covalent link. TON have cytostatic,
CC   immunosuppressive, virucide, anti-HIV, antibacterial and cardiant
CC   activities. The method is used to treat, or prevent, hyperproliferation
CC   (particularly cancers, solid or haematological, including prevention of
CC   metastatic spread); autoimmune diseases; viral or bacterial infections;
CC   endocrine, neural, cardiovascular, pulmonary or reproductive system
CC   disorders. Also where TON or dsRNA are labelled, they can be used for
CC   diagnosis and monitoring of therapy. When linked to a mobile protein,
CC   TON/dsRNA have better cell entry (via endocytosis or other parts of the
CC   mobile protein metabolic process) and longer therapeutic life, increased
CC   from hours to weeks (the result of increased resistance to nuclease),
CC   without loss of affinity for the target. In many cases immune response to
CC   TON/dsRNA is also reduced, as is non-specific binding to endogenous
CC   proteins. The present sequence represents a human p53 oncogene antisense
CC   oligonucleotide, which is a specifically claimed TON from the present
CC   invention.

PT   Isolated nucleic acid molecules having polymorphisms in known human genes
PT   e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT   for locating, identifying and characterizing the genes responsible for
PT   disorder-related traits.
XX
PS   Example 6; Page 109; 714pp; English.
XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a PCR
CC   primer used to amplify the sequences of the invention

PT   Method for killing cancer cells - by exposure to anti:sense
PT   oligo:nucleotide and to free hydroxy radicals.
XX
PS   Claim 2; Col 15; 12pp; English.
XX
CC   A novel method has been produced for killing cancer cells which involves
CC   exposing the cells to an antisense oligonucleotide and to free hydroxy
CC   radicals. The present sequence represents an antisense phosphorothioate
CC   oligonucleotide OL(1)p53 directed against a region in exon 10 of p53.
CC   This anti-p53 oligonucleotide is complementary to at least a portion of
CC   the mRNA transcript of the human p53 gene and is hybridisable to the mRNA
CC   transcript. The method is used to kill cancer cells. The treatment
CC   inhibits the proliferation or kills malignant but not normal cells. When
CC   the antisense oligonucleotide is one that downregulates the path by which
CC   the cancer cells repair oxidative damage to their DNA, the cells are
CC   rendered more susceptible to eradication upon exposure to the hydroxy
CC   radicals

PT   Mammalian asthma related genes, useful for diagnosis of a predisposition
PT   to development of asthma.
XX
PS   Disclosure; Page 63; 195pp; English.
XX
CC   The invention identifies a genetic locus ASTH1, associated with asthma,
CC   mapped to human chromosome 11p. ASTH1I and ASTHIJ are genes present
CC   within the locus, located close to each other on human chromosome 11p,
CC   and have similar patterns of expression, and common sequence motifs. The
CC   ASTH1 genes and fragments, encoded protein, genomic regulatory regions
CC   and anti-ASTH1 antibodies are useful in the identification of individuals
CC   predisposed to development of asthma, and for the modulation of gene
CC   activity in vivo for prophylactic and therapeutic purposes. The ASTH1
CC   protein is useful as an immunogen to raise specific antibodies, in drug
CC   screening for compositions that mimic or modulate ASTH1 activity or
CC   expression, including altered forms of ASTH1 protein, and as a
CC   therapeutic. Sequences AAZ18366-Z18509 represent polymorphisms in the
CC   ASTH1I and ASTH1J genes

PT   Novel MUC nucleic acid corresponding to mucin gene, useful for treating
PT   associated disease conditions e.g. colorectal, breast cancer, cystic
PT   fibrosis and inflammatory bowel disease.
XX
PS   Claim 21; Page 39; 103pp; English.
XX
CC   The invention provides mucin genes (MUC11 and MUC12) located on human
CC   chromosome 7q22. The mucin genes or its portion is used in detecting
CC   polymorphism, mutation, deletion, truncation and expansion in the gene or
CC   its gene transcript. Pharmaceutical compositions and gene therapy
CC   constructs comprising the mucin genes are used for treating disease
CC   conditions associated with aberrant Mucin expression, altered properties
CC   of mucus or epithelial inflammatory processes involving Mucins like
CC   Crohn's disease, ulcerative colitis, asthma, chronic bronchitis and
CC   colorectal cancer, cystic fibrosis, inflammatory bowel disease and breast
CC   cancer. The mucin genes and the polypeptides are used for determining
CC   these diseases or their predisposition. The MUC11 and MUC12 polypeptides
CC   are used for preparing antagonist and antibodies. Sequences AAZ58827-32
CC   represent human MUC11 and MUC12 gene specific primers

PT   Oligonucleotides inhibiting protein kinase, useful for treating diseases
PT   such as cancer and autoimmune disease.
XX
PS   Example 3; Col 27-28; 26pp; English.
XX
CC   This invention describes novel purified aptameric oligonucleotides which
CC   have antimicrobial, cytostatic and immunosuppressive activity. The
CC   oligonucleotides are useful for binding to and preventing or inhibiting
CC   the biological function of a protein kinase or a target molecule and for
CC   detecting the presence or absence of a target molecule in biological
CC   samples. The oligonucleotides are also useful for prophylactic and
CC   therapeutic treatment of diseases such as cancer, autoimmune diseases and
CC   diseases caused by pathogenic microorganisms. This sequence represents a
CC   primer used in the method of the invention

CC   The present invention provides a method of diagnosing a vascular disease
CC   in an individual, involving determining the sequence at various
CC   polymorphic sites within the human thrombospondin 1 and thrombospondin 4
CC   genes. The sequences at a number of polymorphic sites are also provided
CC   in the specification. In particular, the method can be used in the
CC   diagnosis of atherosclerosis, myocardial infarction, coronary heart
CC   disease, stroke, peripheral vascular diseases, venous thromboembolism and
CC   pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
CC   useful in forensics, paternity testing, genetic analysis and phenotype
CC   correlations to diseases. The present sequence is an example of one of
CC   the human gene SNPS shown in the specification

PT Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT and template and primer which do not form a stable duplex in the absence
PT of HCV NS5B.
XX
PS Example; Page 6; 17pp; English.
XX
CC The invention relates to a replicase complex comprising a hepatitis C

```
CC   virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC   complementary nucleic acid primer which is annealed to the 3' terminus of
CC   the template, where the template is at least three nucleotides and the
CC   primer is two or three nucleotides, and the template and primer do not
CC   form a stable duplex in solution in the absence of the HCV NS5B protein.
CC   The complex is useful for detecting HCV replicase activity and permits
CC   establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC   and evaluate antiviral inhibitors and to improve the specificity and
CC   efficacy of the inhibitors. The complex is also useful in the development
CC   of a reliable system for determining kinetic and thermodynamic constants
CC   of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC   mechanistic inhibitors for mis-incorporation or chain termination.
CC   Specifically, the short RNA template and primer pairs are useful in
CC   screening assays which are used for determining kinetic, thermodynamic
CC   and mechanistic properties of NS5B replication and ultimately in the
CC   development of inhibitors of NS5B. Newly identified inhibitors of
CC   replicase activity may be used for developing anti-HCV pharmaceuticals.
CC   Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC   templates

PT   Isolated nucleic acid molecules having polymorphisms in known human genes
PT   e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT   for locating, identifying and characterizing the genes responsible for
PT   disorder-related traits.
XX
PS   Example 24; Page 152; 714pp; English.
XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a
CC   polymorphic DNA sequence of the invention

XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,

```
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Inhibiting angiogenesis in a subject, involves administering at least one
PT   antiangiogenic nucleic acid molecule to the subject.
XX
PS   Claim 2; Page 20; 276pp; English.
XX
CC   The invention relates to inhibiting angiogenesis in a subject, comprising
CC   administering at least one antiangiogenic nucleic acid molecule. Also
CC   included is a kit comprising a first container housing the antiangiogenic
CC   nucleic acids, and instructions for administering them to a subject
CC   having a condition characterised by unwanted angiogenesis. The method is
CC   useful for inhibiting angiogenesis associated with solid tumour growth,
CC   tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,
CC   diabetic retinopathy, retinopathy of prematurity, macular degeneration,
CC   corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
CC   rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque
CC   neovascularisation, telangiectasia, haemophiliac joints, angiofibroma,
CC   wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
CC   hypertrophic scars. The present sequence is an antiangiogenic nucleic
CC   acid of the invention

PT   Treating non-allergic inflammatory diseases, such as psoriasis, eczema,
PT   allergic contact dermatitis, latex dermatitis or inflammatory bowel
PT   disease by administering an immunostimulatory nucleic acid.
XX
PS   Disclosure; Page 10; 229pp; English.
XX
CC   The invention describes a method of treating non-allergic inflammatory
CC   disease comprising administering to a subject having or at risk of
CC   developing a non-allergic inflammatory disease an immunostimulatory
CC   nucleic acid for prevention or treatment of the disease. The method is
CC   useful for treating non-allergic inflammatory diseases, such as
CC   psoriasis, eczema, allergic contact dermatitis, latex dermatitis or
CC   inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease.
CC   This sequence represents an immunostimulatory nucleic acid

PT   Identifying nucleic acid encoding novel sex-linked-tissue-linked
PT   receptors, useful for isolating odorant binding proteins or pesticide
PT   alternatives, by analyzing sequences from a male- and female-specific
PT   nucleic acid library.
XX
PS   Disclosure; Fig 5; 83pp; English.
XX
CC   The present sequence is that of an oligonucleotide used in a method
CC   designed to rapidly array and normalize a complex cDNA library obtained
CC   from a target species. Clones are arrayed into multi-well plates. Each
CC   well contains 16 oligonucleotides with a 5' polylinker, a poly-T run
CC   capable of binding cDNAs by their poly-A tail and a unique 3' sequence,
CC   which allows an anchored oligonucleotide in each well to selectively
CC   hybridise only to those cDNA clones with a complementary 5' end. The
CC   unique 3' key sequences are designed to give a comprehensive level of
CC   degeneracy since they are diverse and numerous enough to ensure that
CC   every possible cDNA sequence can be bound by an individual, specific
CC   oligonucleotide in a single well. The cDNA library is heated to denature
CC   the clones into single stranded DNA, and an aliquot is added to every
CC   well. The anchored oligonucleotide serves as the 3' primer in PCR, and
CC   the common 5' region present in every cDNA clone serves as the 5' priming
CC   site. Denaturing and washing leave anchored cDNA in each well. The
CC   library is now arrayed and normalised. The method was used to identify
CC   and isolate clones encoding G-protein coupled receptors, especially
CC   odourant receptors, and active effectors involved in the olfactory
CC   pathway of invertebrates and vertebrates, e.g. odourant binding proteins,
CC   or other olfactory or neuronal proteins. The identified receptors and
CC   proteins are useful for identifying compounds that reduce a target
CC   animal's sensitivity to odours, for manufacturing compounds or devices
CC   that mask odours, or trapping invertebrates with odourants.
CC   Semiochemicals (e.g. arometics or pheromone mimetics) can be developed
CC   with desirable effects on specific species, for the development of pest
CC   monitoring systems or non-toxic, species-specific pesticide alternatives,
CC   for controlling insect feeding and breeding behaviour, detecting the
CC   presence of small air-borne molecules, etc

PT New radiation hybrid map of the dog, Canine familiaris, genome, useful
PT for e.g. identifying genes implicated in phenotypic and behavioral traits
PT or in genetic diseases and for studying dog pedigrees.
XX
PS Claim 1; Page 87; 87pp; English.
XX
CC The present invention describes a radiation hybrid map of the dog (Canine
CC familiaris) genome comprising the genome location of a marker selected
CC from AAA66139 to AAA66942. The radiation hybrid map is useful for
CC identifying and localising dog genes, since it covers approximately 80 %
CC of the dog genome and provides a dense map integrating different types
CC (i.e. Type I and Type II) of markers. The map and the dog genome markers
CC (or complementary sequences) are especially useful to identify genes
CC responsible for phenotypic and behavioural traits in dogs, to identify
CC morbid genes, to analyse diseases and identify implicated genes in such
CC diseases and their alleles, and to study dog pedigrees. They may also be
CC useful for isolating corresponding human gene sequences e.g. genes
CC involved in genetic diseases

PT New immunostimulatory compositions comprising RNA/DNA hybrid
PT oligonucleotides, useful for enhancing an immune response or inducing
PT cytokines, particularly for treating diseases, e.g. cancer, allergy or
PT HIV infection.
XX
PS Example 11; Page 63; 68pp; English.
XX
CC The present invention relates to an immunostimulatory composition, which
CC comprises at least one oligonucleotide comprising both an RNA region and
CC a DNA region. The composition is useful for enhancing an immune response
CC or inducing cytokines. It can be used as a vaccine adjuvant and in
CC treating diseases, including pathogenic infection, (non-)malignant
CC tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or
CC colon, or carcinomas and sarcomas), autoimmune diseases or allergies
CC (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease,
CC hepatitis, HIV or malaria. The composition is also useful for treating,
CC preventing or ameliorating the symptoms resulting from exposure to a bio-
CC warfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is
CC an immunostimulatory oligonucleotide described in the exemplification of
CC the invention

PT   Measuring telomere length - by forming primer extension prods.
PT   complementary to telomere, or by hybridisation with complementary
PT   labelled probe.
XX
PS   Disclosure; Page 19; 64pp; English.
XX
CC   A method for measuring telomere length has been produced which involves:
CC   (a) covalently attaching an oligonucleotide linker to a telomere; (b)
CC   contacting a primer comprising a sequence sufficiently complementary to
CC   the linker to hybridise specifically under conditions so that the primer
CC   extends to form a primer extension product complementary to the telomere;
CC   and (c) correlating telomere length with primer extension product size,
CC   to provide a measure of telomere length. The present sequence represents
CC   a subtelomeric primer XpJCTN used in this invention. As telomere length
CC   serves as a biomarker for cell turnover, determination of telomere length
CC   can be used to diagnose and stage diseases and conditions such as
CC   tumours, alpha-thalassaemia, liver cirrhosis, muscular dystrophy,
CC   osteoarthritis, Hutchison-Gifford progeria, Down's syndrome,
CC   atherosclerosis, cardiovascular disease, HIV infection and fertility
CC   problems. The methods can also be used to monitor the effectiveness of
CC   various therapeutics in expanding, and/or reducing the proliferative
CC   lifespan of cells. The methods are conducive to high throughput or
CC   automated processes, provide for intracellular and intracellular telomere
CC   length determination and comparison and for the separation of cells or
CC   chromosomes based on telomere length

PT   Determining telomere length by hybridisation of chromosomal DNA with
PT   labelled probe - useful for assessing age and proliferative status of
PT   cells, e.g. for diagnosis and prognosis of cancer and in cell senescence.
XX
PS   Disclosure; Col 11; 23pp; English.
XX
CC   AAV62112-V62122 are primers used in a novel method to determine telomere
CC   length. The method involves treating denatured chromosomal DNA, that has
CC   not been fractionated by gel electrophoresis, with a labelled probe
CC   complementary to a telomere repeat sequence. The amount of bound probe
CC   can be correlated with the telomere length, by comparison with results
CC   for a control of known length. Telomere length is a marker of cell
CC   turnover, e.g. the relative age or proliferative capacity, and its
CC   measurement is used in diagnosis, staging and prognosis of cancer, cell
CC   senescence or other diseases (e.g. liver cirrhosis, muscular dystrophy,
CC   osteoporosis, wound healing and fertility problems). Telomere length can
CC   also be used to monitor treatment with compounds that modulate telomere
CC   length, e.g. in cancer chemotherapy. The method can also be used to
CC   identify modulators of telomere length, telomerase activity or the rate
CC   of telomere loss, and to detect telomerase activity. The method is quick,
CC   with better sensitivity, efficiency, reliability and accuracy than known
CC   methods and does not require gels. The method is suitable for automation
CC   and can be applied to single chromosomes (for comparing interchromosome
CC   variations). The method allows separation of cells and/or chromosomes
CC   according to telomere length

PT   Adenoviral vector for treating tumors and disorders associated with
PT   angiogenesis, such as cancer, arthritis, and psoriasis, comprises a DNA
PT   sequence encoding an angiogenic inhibitor, particularly endostatin.
XX
PS   Example 4; Page 31; 59pp; English.
XX
CC   The present sequence was used in the construction of an adenoviral vector
CC   which includes a DNA sequence encoding endostatin. The adenoviral vector
CC   is useful for expressing endostatin in a mammalian cell such as an A549
CC   or Hep3B cell. It is useful for treating other diseases and disorders
CC   associated with angiogenesis, such as neovascular diseases of the eye,
CC   including diabetic retinopathy, cardiovascular disease, arthritis,
CC   psoriasis, cerebral oedema and intravascular coagulopathy (Kasabach-
CC   Merritt syndrome). The vector inhibits, prevents or destroys the growth
CC   of tumours by preventing the formation of blood vessels in tumours, such
CC   as lymphoma and leukaemia

PT   Treating or preventing choroidal neovascularization comprises increasing
PT   the amount of endostatin in ocular tissues of afflicted individuals to a
PT   choroidal neovascularization inhibiting level.
XX
PS   Example 6; Page 27; 44pp; English.
XX
CC   The present sequence is a primer that was used in the reverse
CC   transcription of human endostatin mRNA. The resulting cDNA was subjected
CC   to PCR amplification and used to generate a recombinant adenoviral vector
CC   encoding human endostatin. A claimed method for the treatment of ocular,
CC   especially choroidal, neovascularisation involves increasing the level of
CC   endostatin, especially human endostatin (see ABB79901) in ocular tissue.
CC   The increase is effected by administering a viral vector, especially an
CC   adenovirus, adeno-associated virus, a retrovirus or lentivirus vector,
CC   comprising an endostatin-encoding nucleic acid. Cells secreting
CC   endostatin may be encapsulated and implanted within an individual

PT   Novel mutant or transformed plant comprising mutated forms of edf1, edf2,
PT   edf3 and edf4 genes, and having decreased ethylene sensitivity, such that
PT   its fruit ripens more slowly than wild-type version of the plant.
XX
PS   Disclosure; Page 34; 85pp; English.
XX
CC   The invention relates to a mutant or transformed plant comprising mutated
CC   forms of ethylene-response DNA-binding factors (edf)1, edf2, edf3 and
CC   edf4 genes such that the plant exhibits a decreased response to ethylene,
CC   and comprises fruit which ripens more slowly than a wild-type version of
CC   the plant. The transgenic plants having reduced sensitivity to ethylene
CC   are useful for floral industry and fruit processing industries. Since
CC   ethylene is involved in floral senescence, the modified plants have
CC   longer flower longevity. The modified plants e.g. lettuce, spinach, other
CC   leafy vegetables provide higher yields due to decreased floral
CC   initiation, since the transformed plants do not bolt or flower easily.
CC   The plants provide fruits which ripens more slowly than the wild-type
CC   version of the plant, and thus are advantageous in post-harvest and
CC   transportation conditions. This polynucleotide sequence represents an
CC   overlapping oligonucleotide relating to the ethylene sensitivity
CC   modulation of the invention

PT   Vaccinating against tumors, infectious diseases, allergies and asthma
PT   using immunostimulatory Py-rich and TG nucleic acids.
XX
PS   Disclosure; Page 39; 338pp; English.
XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Genotyping nucleic acid samples for interleukin-1 (IL-1) proinflammatory
PT   haplotype alleles, useful for predicting susceptibility to developing
PT   chronic obstructive airway disease.
XX
PS   Disclosure; Page 7; 37pp; English.
XX
CC   The present invention describes genotyping a nucleic acid sample from a
CC   subject to determine at least one allele of an interleukin-1 (IL-1)
CC   proinflammatory haplotype. A method has also bee described for
CC   determining a subject's susceptibility to developing chronic obstructive
CC   airway disease (COAD) or for predicting the rapidity or ultimate
CC   progression of a COAD in the subject by: (a) obtaining a nucleic acid
CC   sample from the subject; and (b) detecting at least one allele of an IL-1
CC   proinflammatory haplotype in the sample, where detection of at least one
CC   of these alleles indicates that the patient has an increased
CC   susceptibility to developing COAD. The method is useful for determining
CC   the susceptibility of subjects to developing chronic obstructive airway
CC   disease or for predicting the rapidity or ultimate progression of chronic
CC   obstructive airway disease (COAD). COAD can be asthma, emphysema, chronic
CC   bronchitis or chronic bronchiolitis. The method provides for early
CC   identification of chronic obstructive airway disease (COAD), facilitating
CC   administration of appropriate treatment at the earliest stage, thereby
CC   increasing the probability of a positive outcome. The present sequence
CC   represents a PCR primer used in the method of the invention

PT Novel human UDP-glucuronosyltransferase sequence, polymorphisms for
PT genotyping individuals to predict rate of metabolism of substrates and
PT for identifying potential drug interactions.
XX
PS Example 2; Page 22; 72pp; English.
XX
CC This sequence represents a primer used to sequence polymorphic fragments
CC of the human UDP-glucuronosyltransferase 2B7 (UGT2B7) gene. UDP-
CC glucuronosyltransferases (UGTs) are a family of enzymes that catalyse the
CC glucuronic acid conjugation of a wide range of endogenous and exogenous
CC substrates. The UGT2B gene subfamily encode steroid metabolizing isoforms
CC in the liver. Alteration of the expression or function of UGTs may effect
CC drug metabolism. The invention relates to non-chromosomal nucleic acid
CC molecules, which comprise human UGT2B sequence polymorphisms (see
CC AAZ95051-Z95110). Probes which detect the UGT2B locus polymorphisms can
CC be used to detect altered UGT2B metabolism of a substrate in an
CC individual. The nucleic acid molecules comprising a human UGT2B sequence
CC polymorphism can be used in screening assays for genotyping individuals,
CC also to predict their rate of metabolism of UGT2B substrate, potential
CC drug-drug interactions and adverse side effects. The polymorphisms can be
CC used as single nucleotide polymorphisms (SNPs) for detecting genetic
CC linkage related to phenotypic variation in activity or expression of
CC UGT2B protein. The polymorphism containing nucleic acid molecules may
CC also be used for generating genetically modified non-human animals and
CC for obtaining site specific gene modification in cell lines

PS   Example 2; Page 16; 46pp; English.
XX
CC   Reporter probes AAC61623-26 were used to discriminate between different
CC   alleles of the human interleukin 1beta (IL-1beta) gene. The method of the
CC   invention was used for detecting single nucleotide polymorphisms (SNPs)
CC   in the IL-1beta gene. The method utilises electronic circuitry on silicon
CC   microchips. The method provides accurate discrimination of amplified DNA
CC   samples following electronic transport, concentration, and attachment of
CC   DNA to selected electrodes (test sites). The test sites make up organised
CC   arrays of samples that are distinguished by using internal controls of
CC   dual labelled reporters comprising wild type and mismatched sequences to
CC   validate the SNP genotype. Multiples of SNPs in target nucleic acids from
CC   a patient sample source or a SNP in target nucleic acids of multiple
CC   patient sample sources can also be detected using the electronically
CC   addressable microchip

PT Determining the dose of a UGT2B7-glucuronidated drug for treating cancer,
PT comprises determining the level of UGT2B7 activity or expression in a
PT patient.
XX
PS Disclosure; Page 53; 160pp; English.
XX
CC The invention relates to an UDP-glucoronosyl transferase (UGT) enzyme,
CC UGT2B7. The invention also relates to compositions and methods for
CC optimising UGT2B7 substrate dosings and for predicting UGT2B7 substrate
CC toxicity. The method is useful in determining the dose of a UGT2B7-
CC glucuronidated drug that may be used in treating cancer patients. It is
CC also useful in determining persons at risk for epirubicin toxicity, in
CC reducing or eliminating side effects associated with epirubicin
CC treatment, and in ways of increasing the efficacy of dosage regimens. The
CC present sequence is a primer used for sequencing human UGT2B7 DNA

PT Displaying a protein of interest on spore surface, by transforming a host
PT cell with a vector comprising a gene encoding a spore coat protein and a
PT gene encoding a protein of interest, useful for preparing protein
PT microarray.
XX
PS Example 4; Page 143; 158pp; English.
XX
CC The present invention relates to a new method for displaying a protein of
CC interest on a spore surface. The method of the invention involves
CC preparing a vector comprising a gene construct containing a gene encoding
CC a spore coat protein and a gene encoding a protein of interest,
CC transforming a host cell with the vector, displaying the protein of
CC interest on a surface of a spore of the host cell, and recovering the
CC spore. The method is useful for producing a delivery system for
CC recombinant live vaccine. The method is also useful for improving a
CC protein of interest using a resistance property of spore, in
CC bioconversion reactions, for preparing protein microarray, for producing
CC an antibody to antigen in vertebrates, and for preparing a whole cell
CC absorber. The spore coat proteins used circumvent a necessity for passage
CC across cell membrane, so that they do not need secretion signal and
CC target signal which are prerequisites of surface display motif, therefore
CC ensuring a surface display of protein, such as beta-galactosidase, in
CC orderly fashion, which is difficult to pass across cell membrane. The
CC present nucleic acid sequence represents a Bacillus subtilis
CC carboxymethyl cellulase (CMCase) PCR primer that was used in the methods
CC of the invention for construction of recombinant vectors

PT Arraying genome clones.
XX
PS Claim 4; Page 49; 528pp; Japanese.
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC represent PCR primers for human chromosome 21q22.1, which are
CC specifically claimed for use in the present invention

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 55; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The

```
CC   oligonucleotides are useful for determining the presence, absence or
CC   identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC   assess by association analysis the genotype of an individual or group of
CC   individuals, having a pathological phenotypic trait suspected of being
CC   caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC   agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC   dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC   osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC   traits also include symptoms of or susceptibility to multifactorial
CC   disease of which a component is or may be genetic such as autoimmune
CC   diseases, including, rheumatoid arthritis, multiple sclerosis,
CC   inflammation, cancer, nervous system diseases and infection by pathogenic
CC   microorganism. The method is also useful in forensic investigations and
CC   paternity analysis. The present sequence represents a single nucleotide
CC   primer extension (SNPE) primer specific for a human SNP containing DNA
CC   sequence

PT Identification of oligo:nucleotide(s) with a desired activity, e.g.
PT activity against an infectious agent - by cloning vectors contg. randomly
PT sequenced oligo:nucleotide(s) into cells and assaying for the desired
PT phenotype.
XX
PS Claim 25; Page 25; 53pp; English.
XX
CC AAQ98161 is a random oligonucleotide Hind III primer/adaptor used in a
CC new method for the identification of random oligonucleotides which
CC inhibit the expression of a target gene, e.g. the beta-galactosidase gene
CC in E. coli. Such random oligonucleotides may be used in the treatment of
CC infectious diseases, pref. herpes simplex virus infection

PT Depletion of transplantation antigens in donor cells - using anti-sense
PT or triplex-forming oligonucleotide(s), used for treating auto-immune
PT disease and in transplants.
XX
PS Example; Page 22; 71pp; English.
XX
CC The sequences given in AAQ47176-77 represent triplex forming oligo-
CC nucleotides which bind to the mRNA sequence of the MHC class II locus DR
CC A structural gene at positions 851-876. The sequences given in AAQ47178-
CC 80 represent control oligomers which contain base compositions similar to
CC that around this DR A region but not containing the correct sequences. DR
CC A is a transplantation antigen. Binding of this sequence to the DR A gene
CC inhibits antigen production. This method may be used for treating
CC individuals with autoimmune disease, characterised by dysfunctional
CC expression of a transplantation antigen. It may also be used to produce
CC cells which are more easily transplanted into a recipient. (Updated on 25

PT New altered CD40L promoter for use in the study, diagnosis and treatment
PT of a variety of inflammatory disorders and autoimmune diseases, such as
PT rheumatoid arthritis.
XX
PS Example 1; Fig 3; 90pp; English.
XX
CC The present invention describes an isolated, purified nucleic acid, which
CC is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC residues 331-455 of the sequence comprising 455 nucleotides given in
CC AAF74905 where A in the wild type sequence at position 331 (corresponding
CC to position -125) is replaced with C. (I) has antiarthritic,
CC antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC be used in gene therapy. (I) is useful in the study, diagnosis and
CC treatment of inflammatory and autoimmune diseases, as well as diseases in
CC which elevated expression of CD40L is a factor, e.g., rheumatoid
CC arthritis. The present sequence represents a CD40L poly-A tract sequence
CC which is used in an example from the present invention

PT   New oligo:nucleotide clamps that stably bind to target polynucleotide(s)
PT   - may be used in diagnosis and therapy to inhibit genes or mRNA of, e.g.,
PT   herpes:virus, HIV, oncogene(s), etc.
XX
PS   Example 10; Page 28; 44pp; English.
XX
CC   The oligonucleotide clamps AAQ85069 and AAQ85070 are specific for a ss,
CC   or ds target nucleotide. When bound to the target sequence the two
CC   oligonucleotides form a stable non-covalent link, clamping the target
CC   sequence. This technique may be used to inhibit the expression, or
CC   function of an exogenous gene in a host (pref. human). The gene may be
CC   from herpes virus, cytomegalovirus, human papilloma virus, HIV or an
CC   oncogene. Therefore the clamps may be used in the treatment and diagnosis
CC   of human viral diseases. (Updated on 25-MAR-2003 to correct PN field.)

PT   Synthesis of branched polymers and novel branched polymeric structures -
PT   used as molecular probes esp. for detecting poly-nucleotide(s).
XX
PS   Example 5; Page 31; 52pp; English.
XX
CC   This sequence represents an oligonucleotide clamp which was used to bind
CC   a target sequence comprising a segment of the HIV pol and nef genes in
CC   single stranded or double stranded forms. An oligonucleotide clamp is a
CC   compound capable of forming a covalently closed macromolecule or a stable
CC   circular complex after specifically binding to the target polynucleotide.
CC   The hinge region of this molecule comprises free amines. Oligonucleotide
CC   clamps generally comprise one or more oligonucleotide moieties capable of
CC   specific binding to the target molecule and one or more pairs of binding
CC   moieties covalently linked to the oligonucleotide moieties. Upon
CC   annealing of the oligonucleotides moieties to the target polynucleotide,
CC   the binding moieties of a pair are bought into juxtaposition so that they
CC   form a stable covalent or non-covalent linkage or complex. The
CC   interaction of the binding moieties effectively clamps the specifically
CC   annealed oligonucleotide moieties to the target polynucleotide. (Updated
CC   on 25-MAR-2003 to correct PN field.)

PT   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular
PT   template to produce oligonucleotide multimer for cleavage.
XX
PS   Example 18; Col 57; 38pp; English.
XX
CC   The present sequence represents an oligonucleotide used in an example of
CC   the present invention. The present invention describes a method for
CC   synthesising a selected oligonucleotide (I) having well defined ends. The
CC   method comprises: (a) annealing a primer to a single-stranded (ss)
CC   circular template to yield a primed circular template, where the template
CC   comprises: (i) at least one nucleotide sequence complementary to (I); and
CC   (ii) at least one nucleotide effective to produce a cleavage site in the
CC   oligonucleotide multimer; (b) combining the primed circular template with
CC   at least two types of nucleotide triphosphates and a polymerase enzyme
CC   without the addition of auxiliary proteins to yield a ss oligonucleotide
CC   multimer complementary to the circular oligonucleotide template,
CC   comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC   multimer at the cleavage site to produce (I) having well defined ends.
CC   The method is used for the large-scale synthesis of DNA and RNA oligomers
CC   for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT   Synthesis of oligo:nucleotide(s) - using a single-stranded circular
PT   oligo:nucleotide template ribonucleotide tri:phosphate(s) and a
PT   polymerase to form multimer(s) which can be cleaved.
XX
PS   Example 18; Page 59; 100pp; English.
XX
CC   The oligomer sequence ID No.38 was used in an example of the invention
CC   for synthesising an RNA oligonucleotide, comprising combining a single-
CC   stranded circular oligonucleotide template comprising at least one copy
CC   of a nucleotide sequence complementary to the sequence of the desired RNA
CC   oligonucleotide with at least 2 types of ribonucleotide triphosphate and
CC   a polymerase enzyme to yield a single-stranded RNA oligonucleotide
CC   multimer complementary to the circular oligonucleotide template, where
CC   the RNA oligonucleotide multimer comprises multiple copies of the desired
CC   RNA oligonucleotide. The methods can be used for producing RNA
CC   oligonucleotides having a specific sequence and well defined ends. The
CC   RNA oligonucleotides produced can be used as probes, standards and
CC   diagnostic or therapeutic agents. They can be used for modifying the
CC   structure or function of a target molecule. They can also be used to
CC   cleave disease-associated RNA, DNA or protein

CC   This oligo(T) synthetic oligonucleotide was used for first strand cDNA
CC   synthesis from total RNA isolated from either logarithmically growing or
CC   quiescent 10T1/2 mouse fibroblast cells. It was also used with an
CC   arbitarary d(N10) primer in PCR. The PCR products were used in a
CC   differential display to identify the mSARP1 gene (see AAV19112) that
CC   codes for novel murine secreted apoposis-related protein mSARP1 (see
CC   AAW37814). The invention relates to SARP polynucleotides (see also
CC   AAV19113-15) and polypeptides (see also AAW37815-17), antibodies specific
CC   for SARP, and use of such polynucleotides and antibodies in diagnostic
CC   and therapeutic methods, and methods for treating diseases related to the
CC   regulation of SARP expression in tissue and body fluid samples, including
CC   cancers

PT New nucleic acid comprising hop mosaic virus gene - used in method for
PT detection of hop mosaic virus.
XX
PS Example 3; Page 14; 38pp; English.
XX
CC The present invention describes a hop mosaic virus gene. The present
CC invention also describes a method of assaying for the presence of hop
CC mosaic virus in a hop sample, comprising: (a) treating an isolated and
CC purified nucleic acid (I) comprising the hop mosaic virus gene or a
CC fragment of the gene with a sample containing nucleic acid (II) obtained
CC from hop; and (b) detecting the presence of hybridisation between (I) and
CC (II); or (c) by PCR amplification of (II) with (I), where the fragment
CC comprises at least 15 nucleotides, and detection of the products. Plural
CC detection procedures required in conventional immunological methods are
CC unnecessary using the method of the invention, which allows for quicker
CC detection of hop mosaic virus. The method also allows for the diagnosis
CC of hop mosaic virus infection with a higher accuracy than the
CC conventional ELISA. The present sequence represents a PCR primer used in
CC the present invention to amplify Calravirus which belongs to the same
CC group as hop mosaic virus

PT Identifying tissue (tumor)-specific polynucleotides overexpressed in
PT tissue of interest as compared to control tissue, for detecting cancer
PT cells in patient, comprises DNA microarray analysis or quantitative
PT polymerase chain reaction.
XX
PS Claim 40; Page 42; 127pp; English.
XX
CC The invention relates to identifying tissue-specific polynucleotides (P)
CC that involves performing a genetic subtraction to identify pool of (P)
CC from tissue of interest (TI), performing DNA microarray analysis to
CC identify first subset of polynucleotides (SP1) at least 2-fold over
CC expressed in TI, and performing quantitative polymerase chain reaction
CC (PCR) analysis on SP1 to identify second subset of (P). The method is
CC useful for determining the presence or absence of a cancer cell in a
CC patient, monitoring the progression of cancer in a patient using a
CC biological sample such as blood, serum, lymph nodes, bone marrow, sputum,
CC urine or a tumour biopsy sample. The methods are useful for determining
CC the presence or absence of or monitoring progression of prostate, breast,
CC colon, ovarian, lung, head and neck, lymphoma, leukemia, melanoma, liver,
CC gastric, kidney, bladder, pancreatic or endometrial cancer. Sequences
CC AAI67256-265 represent primers and probes used in quantitative real-time
CC PCR analysis of breast tumour specific genes

PT   Detecting collagen gene alteration, useful for diagnosing osteoporosis,
PT   multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of
PT   stature and low bone density in humans.
XX
PS   Example 4; Fig 21; 617pp; English.
XX
CC   The invention relates to Detecting a collagen gene alteration associated
CC   with a pathological condition in a human subject by obtaining from the
CC   subject a sample nucleic acid containing a portion of at least 15
CC   consecutive nucleotides of the segment of the COL1A1 gene extending in
CC   the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent
CC   exon 28 through the 3' end of intron 51, where the portion contains an
CC   intronic nucleotide and a first and second site, determining the sequence
CC   of the portion and comparing the sequence of the portion with the
CC   corresponding consensus sequence of the COL1A1 gene where a difference
CC   between the sequence of the portion and the consensus sequence indicates
CC   the presence of the collagen alteration in the subject. The method is
CC   used for detecting abnormalities in a COL1 or COL9 gene is useful for
CC   determining whether a subject is afflicted with pathological conditions
CC   associated with an altered collagen gene such as osteoporosis, multiple
CC   epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and
CC   low bone density. Identification of an abnormality in a collagen gene is
CC   also useful for designing a therapeutic nucleotide or gene therapy agent
CC   which can be administered to the subject to correct or alleviate the
CC   abnormality. The method is useful for detecting mutations in both the
CC   coding and non-coding sequences of any of the COL1 or COL9 genes.
CC   Therefore the method can be used to detect collagen gene alterations
CC   which affect either the primary sequence of a collagen protein chain,
CC   splicing of the mRNA encoding such chains or regulation of expression of
CC   the genes encoding such chains. The present sequence is a PCR primer
CC   which amplifies a nucleic acid from a collagen gene of the invention

PT Determining a functional allele profile of a gene in a population by
PT identifying the nucleotide sequence of a gene of genomic DNA from each of
PT the individuals with a family history of functional alleles of the gene
PT of interest.
XX
PS Example 2; Page 10; 28pp; English.
XX
CC The present invention relates to a method for determining a functional
CC allele profile of a gene in a population. The method comprises
CC identifying the nucleotide sequence of a gene of interest out of genomic
CC DNA from each of a population of individuals identified as having a
CC family history which indicates inheritance of functional alleles of the
CC gene of interest, and rank ordering the frequency of occurrence of each
CC haplotype, where the identity of the alleles containing each haplotype
CC and the determination of their relative frequencies constitutes the
CC functional allele profile of the gene of interest in the population. The
CC method is useful for determining functional allele profiles which are
CC useful in the treatment and diagnosis of diseases, for genetic and
CC pharmacogenetic applications, and for evaluating the degree to which the
CC gene(s) are under selective pressure. The present sequence represents a
CC PCR primer used in the method of the invention.

XX
PT Single chain fusion proteins and antibodies - useful to diagnose and
PT treat cancer, specifically bind Lewis(Y) related carbohydrate antigen.
XX
PS Example 1; Page 33; 116pp; English.
XX
CC A novel recombinant DNA molecule which encodes a single chain fusion
CC protein or antibody comprising the Fv region of both the light and heavy
CC chains of an antibody (Ab) fused together, and an effector molecule,
CC where the fusion protein or Ab has the binding specificity of monoclonal
CC Ab (MAb) B1, B3 or B5, can be used for the production of such fusion
CC proteins or antibodies. The fusion proteins can be used in compositions
CC as an immunotoxin to inhibit tumour cell growth. The single chain
CC antibody can be used to detect the presence or absence of cells bearing a
CC Lewis(Y) carbohydrate antigen in a patient. The antibodies are also
CC useful as multiple targetting moieties, providing at least 2 kinds of
CC biological activity. They can also be used in diagnostic assays and for
CC the imaging of tumours when attached to a radiolabel and for the
CC pathological diagnosis of tumours. Humanised antibodies are less
CC immunogenic than the mouse MAbs B1, B3 and B5, making them more suitable
CC for long term treatment. The primers used for amplifying the Fv heavy and
CC light chain sequences of the B1, B3 and B5 MAb's are described in

PT Treatment of airway diseases such as asthma - by topically applying
PT adenosine-free antisense oligo:nucleotide to airway epithelium of
PT subject.
XX
PS Claim 5; Page 31; 71pp; English.
XX
CC A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide HUMIL6AS2
CC specific for the human IL6. The method can be used to treat airway
CC diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary
CC disease, bronchitis and other airway diseases characterised by an
CC inflammatory response. By eliminating adenosine from the antisense ON,
CC its liberation upon antisense degradation is prevented, thereby
CC preventing adenosine-induced bronchoconstriction in patients with hyper-
CC reactive airways

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Claim 18; Page 414; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 210; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   Producing protein or DNA libraries which are useful for improving
PT   existing proteins, by in vitro translating protein coding sequences to
PT   produce RNA-protein fusions and incubating these protein fusions under
PT   high salt conditions.
XX
PS   Disclosure; Page 43; 121pp; English.
XX
CC   The present sequence is one of a number of oligonucleotides which were
CC   used for the generation of RNA-protein fusions, including fusions having
CC   a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC   linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC   and in vitro or in situ translation of an mRNA molecule with a peptide
CC   acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC   under high salt conditions to produce a protein library. This method is
CC   useful for improving or altering existing proteins, as well as for
CC   isolating new proteins and nucleic acid or small molecule targets. It may
CC   also be used to improve human or humanised single-chain antibodies for
CC   the treatment of a number of diseases. The method is useful for the
CC   isolation of proteins with specific binding properties, for screening
CC   cDNA libraries and cloning new genes on the basis of protein-protein
CC   interactions. Unlike prior art, the new method does not rely on
CC   maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC   complex, which is very fragile and is therefore of limited use. The
CC   method does not rely on topological links between the protein and the
CC   nucleic acid so that the information of the protein is retained and can
CC   be recovered in readable, nucleic acid form

PT   A human Hsmar1 polypeptide 15.95, useful for curing e.g. tumors and
PT   diabetes.
XX
PS   Example 3; Page 19 (Disclosure); 32pp; Chinese.
XX
CC   The invention relates to human mariner1 transposase (Hsmar1) protein
CC   15.95 (ABB09530) and nucleic acids encoding it (ABQ77629). The protein
CC   has a molecular weight of 15.95 kD and has 84% identity and 91% homology
CC   over a 145 amino acid stretch with human mariner1 transposase given in
CC   GenBank accession number U52077. The invention also relates to a method
CC   for the recombinant production of the protein, an antagonist of the
CC   protein, and the use of the protein, gene and antagonist in therapeutic
CC   applications. Hsmar1 protein 15.95 can be used in the treatment of a
CC   variety of diseases such as embryonic development disorders, tumours,
CC   diabetes, menstrual disorders, peptic ulcers, arrhythmia, anaemia and
CC   epilepsy. The present sequence represents cDNA encoding human Hsmar1
CC   protein 15.95. Sequences ABQ77630-ABQ77631 represent reverse
CC   transcription-PCR (RT-PCR) primers used in an exemplification of the
CC   invention to isolate human Hsmar1 protein 15.95 cDNA

PT   New proteins containing GRRS which are invisible to the immune system -
PT   used for treating cancer, immune system disorders, viral diseases, etc.
XX
PS   Example 1; Page 43; 61pp; English.
XX
CC   AAT39966-T39973 represent double stranded coding sequences for minimal
CC   motifs of glycine-rich repeat sequences (GRRS). Full length GRRS
CC   sequences, such as the Epstein-Barr virus strain B95.8 nuclear antigen
CC   (EBNA1) represented by AAW05704, can be used in the method of the
CC   invention. The method of the invention is for making an antigenic protein
CC   invisible to the immune system, and consists of inserting a GRRS into the
CC   antigenic protein. The method can be used to insert a GRRS into
CC   therapeutic proteins, marker genes, regulatory proteins of viral vectors,
CC   or vaccine components. The therapeutic proteins include enzymes,
CC   cytokines, lymphokines, cell adhesion molecules, costimulatory molecules,
CC   or protein products of drug resistant genes or tumour suppressor genes.
CC   The antigenic proteins or corresponding nucleic acids are used to treat
CC   genetic and viral diseases, especially enzyme disorders such as Gaucher's
CC   disease, cancer, immune system disorders and other diseases treatable by
CC   gene therapy

PT   Pollinosis-associated gene 787 undergoing significantly low expression in
PT   subjects after pollen scattering, useful in diagnosis of allergic
PT   diseases and screening candidate compounds to regulate response of T
PT   cells to antigen stimulus.
XX
PS   Example 12; Page 26-27; 54pp; Japanese.
XX
CC   The invention relates to the human pollinosis-associated gene 787 which
CC   exhibits significantly reduced expression in the T-cells of individuals
CC   after the pollen-scattering season, relative to expression levels in T-
CC   cells before the pollen-scattering season. The gene was isolated from T-
CC   cells from individuals allergic to pollen using the differential display
CC   method. The invention also relates to pollinosis-associated gene 787
CC   primers and probes; methods of detection of pollinosis-associated gene
CC   787 nucleic acids; and a method of diagnosis of allergic diseases via the
CC   detection of pollinosis-associated gene 787 nucleic acids. The invention
CC   additionally encompasses a method of screening drug candidates for the
CC   treatment of allergic disease by measuring the expression of pollinosis-
CC   associated gene 787 in pollen antigen-stimulated T-cells in the presence
CC   of a test compound relative to a control. Pollinosis- associated gene 787
CC   is useful in the diagnosis of allergic diseases and in the screening of
CC   drug candidates for the treatment of such diseases. The present sequence
CC   represents a PCR primer used in the isolation of human pollinosis-
CC   associated gene 787 cDNA

PT   Novel polypeptide-human uridylic acid kinase 11 and polynucleotide for
PT   coding for polypeptide.
XX
PS   Example 2; Page 17 (disclosure); 32pp; Chinese.
XX
CC   The present invention relates to the isolation of human uridylic acid
CC   kinase 11, and the polynucleotide encoding it. Also described is the
CC   process for preparing the polypeptide by DNA recombination and the
CC   application of the polypeptide and polynucleotide in treating diseases,
CC   such as sterility, pregnant pathological disease, embryonic development
CC   disturbance, dysgenesis, some tumours and some inherited diseases.
CC   Antagonists against the polypeptide can also be used in treating such
CC   diseases. The present sequence for reverse transcriptase (RT)-PCR primer
CC   #2 is used with RT-PCR primer #1 (ABK13944) for isolating cDNA encoding
CC   human uridylic acid kinase 11

PT   Determining unknown genomic sequence segments, useful e.g. for
PT   identifying integration sites in transgenic plants, that border a known
PT   sequence.
XX
PS   Example 4; Page 6; 32pp; German.
XX
CC   The invention relates to determining, even in a very complex genome,
CC   unknown sequence segments that flank a known segment. The 5' end of the
CC   unknown sequence is determined by: (a) cleaving genomic DNA with a
CC   restriction enzyme; (b) hybridising cleavage products with a labelled
CC   probe, optionally also an unlabelled bridging probe; (c) purifying the
CC   single-stranded product that has hybridised; (d) attaching a double-
CC   stranded adapter to one end of the single stranded product, optionally
CC   also attaching labelled probe to the other end; (e) preparing and
CC   amplifying the double stranded DNA; and (f) sequence analysis of the
CC   amplicon. The 3' end of the unknown sequence is determined similarly. The
CC   method is used to determine the integration site of a foreign or natural
CC   DNA (introduced by transformation or crossing) in the genome and to
CC   identify promoters, terminators or unknown genes, particularly in animal
CC   or especially cereal plant genomes. The present sequence is that of a PCR
CC   primer useful in examples of the invention analysing barley DNA for
CC   agrobacterium transformation

PT   Isolated polynucleotides encoding human stearoyl-CoA desaturase with
PT   delta-9 desaturase activity, useful for preventing diagnosing and
PT   treating e.g. cardiovascular disease, baldness and skin diseases.
XX
PS   Example 2; Page 32; 53pp; English.
XX
CC   The invention relates to isolated polynucleotides encoding human stearoyl
CC   -CoA desaturase (hSCD5) with Delta-9 desaturase activity. HSCD5 may be
CC   used in the prevention, diagnosis and treatment of diseases associated
CC   with inappropriate hSCD5 expression and used to treat disorders
CC   associated with decreased expression by rectifying mutations or deletions
CC   in a patient's genome that affect the activity of hSCD5 by expressing
CC   inactive proteins or to supplement the patients own production of hSCD5.
CC   Disorders that may be prevented and/or treated using the modulators
CC   including, for example cholesterol disorders, lipidaemias, cardiovascular
CC   disease, diabetes, obesity, baldness, skin diseases, cancer and multiple
CC   sclerosis. Human SCD5 is used in gene therapy and protein therapy and
CC   also used as vaccine. The present sequence is human SCD5 cDNA amplifying
CC   PCR primer

PT Polynucleotides comprising minimally cross-hybridizing nucleotide
PT sequences, useful as tags or tag complements for use in a wide variety of
PT research, medical or industrial applications, e.g. in diagnostic assays
PT or DNA sequencing.
XX
PS Example 2; Page 74; 120pp; English.
XX
CC The invention relates to a composition, which comprises molecules for use
CC as tags or tag complements. Each molecule comprises an oligonucleotide
CC selected from a set of oligonucleotides based on numeric identifiers
CC (numerals 1-3) corresponding to the pattern of nucleotide bases present
CC in 1168 nucleotide sequences fully defined in the specification. These
CC oligonucleotides were found to be non-cross hybridising. The composition
CC is useful as a tag or tag complement, in analysing a biological sample
CC for the presence of a mutation or polymorphism at a locus in a nucleic
CC acid, and in determining the presence of a target suspected of being
CC contained in a mixture. Also for use in a wide variety of research,
CC medical, or industrial applications, e.g. identification of disease-
CC related polynucleotides in diagnostic assays, screening for clones of
CC novel target polynucleotides, identification of specific polynucleotide
CC in blots of mixtures of polynucleotides, therapeutic blocking of
CC inappropriately expressed genes or DNA sequencing. The polynucleotides of
CC the composition are particularly useful in methods involving highly
CC parallel processing of analytes. The use of the polynucleotides provides
CC minimal cross-hybridisation or cross-talk during the sorting process.
CC Thus, any sequence within the family of sequences will not significantly
CC cross-hybridise with any other sequence derived from that family, making

```
CC   it suitable for highly parallel processing of analytes. ABS61529-ABS62696

XX
PT   Discrimination of a cancer cell in a sample tissue, comprises determining
PT   the expression level of a reverse transcriptase component of telomerase
PT   using a hybridization assay.
XX
PS   Example; Page 6; 16pp; Japanese.
XX
CC   The present invention relates to a method for the discrimination of a
CC   cancer cell in a sample tissue, which involves determining the expression
CC   level of a reverse transcriptase component of telomerase in a cell
CC   constituting the sample tissue by an in situ hybridization of the mRNA of
CC   the enzyme, and judging a cell showing a higher expression level than
CC   that of the reverse transcriptase component of telomerase in a normal
CC   cell to be a cancer cell. The present sequence is a PCR primer used in
CC   the exemplification of the invention

PT New human sailor transposase 12.87 polypeptide for treating malignant
PT tumors, hemopathy, human immunodeficiency virus infection, immunological
PT diseases, and various inflammations.
XX
PS Example 2; Page 17 (disclosure); 33pp; Chinese.
XX
CC The present invention discloses a new kind of polypeptide, human sailor
CC transposase 12.87, polynucleotides encoding the polypeptide and a DNA
CC recombination process to produce the polypeptide. The present invention
CC also discloses applying the polypeptide in treating various diseases,
CC such as malignant tumours, haemopathy, human immunodeficiency virus (HIV)
CC infection, immunological diseases, and various inflammations. The present
CC invention also discloses the antagonist resisting the polypeptide and its
CC treatment effect. The present invention also discloses application of the
CC polynucleotides encoding human sailor transposase 12.87. The present
CC sequence is a reverse transcriptase (RT)-PCR primer used to isolate
CC nucleic acids encoding sailor transposase 12.87

PT New modified Cry protein, useful as insecticide, comprises at least one
PT additional pepsin cleavage site to reduce persistence in mammalian gut.
XX
PS Example 3; Page 26; 134pp; French.
XX
CC The present invention describes a modified Cry protein (I) that is
CC sensitive to pepsin and comprises at least one additional pepsin cleavage
CC site (PCS). Also described: (a) increasing pepsin sensitivity of Cry
CC proteins by incorporating at least one extra PCS; (b) polynucleotides
CC (II) that encode (I); (c) chimeric genes (CG) that contain a promoter,
CC (II) and terminator; (d) expression or transformation vector (III) that
CC contains CG; (e) host organism (IV) transformed with (III), also, where
CC the organism is a plant, its parts and seeds; (f) production of (I) by
CC growing (IV); and (g) mono- or polyclonal antibodies (Ab) directed
CC against (I). (I) has insecticide activity. (I) can be used as
CC insecticides, particularly where expressed in transgenic plants. (I) are
CC sensitive to enzymes in the digestive tract of mammals, so do not persist
CC in the tract (lack of persistence is required by regulatory authorities
CC for use, in foods, of seeds containing Cry proteins). Extra PCS do not
CC increase degradation in the digestive tract of insects, so have no effect
CC on insecticidal activity. ABV93450 to ABV93909 and ABP67997 to ABP68308

XX
CC   This sequence represents an oligonucleotide used in a novel method for
CC   the direct and complete determination of long DNA sequences of
```

```
CC   restriction enzymes from PCR products. The method allows independent
CC   recognition of amplified DNA fragments at both ends and removal of one
CC   primer binding site can be carried out and leads to the following steps:
CC   (1) the resultant cleaved PCR fragment having the one primer binding site
CC   is used as a template for the simultaneous determination of the PCR
CC   fragment and the downstream fragment; (2) the fragments can be used for
CC   the determination of long DNA sequences; (3) the PCR amplification of 2
CC   primers provide replacements of the both ends with different restriction
CC   enzyme fragments; and (4) the above mentioned steps may give polarity of
CC   the fragment at both ends for integration in vectors and may be applied
CC   for preparation of samples

PT   New genotyping oligonucleotide, useful for detecting the presence,
PT   absence or identity of single polynucleotide polymorphism in a nucleic
PT   acid sample.
XX
PS   Claim 1; Page 68; 83pp; English.
XX
CC   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC   primer extension (SNPE) primers, and the sequences of regions flanking
CC   sites of single nucleotide polymorphisms SNPs. The present invention
CC   includes kits for determining the presence or absence of a SNP, using the
CC   oligonucleotides of the invention. The PCR primers are used to amplify a
CC   SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC   The oligonucleotides are useful for genotyping a nucleic acid sample by
CC   performing a single-nucleotide primer extension reaction. The
CC   oligonucleotides are useful for determining the presence, absence or
CC   identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC   assess by association analysis the genotype of an individual or group of
CC   individuals, having a pathological phenotypic trait suspected of being
CC   caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC   agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC   dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC   osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC   traits also include symptoms of or susceptibility to multifactorial
CC   disease of which a component is or may be genetic such as autoimmune
CC   diseases, including, rheumatoid arthritis, multiple sclerosis,
CC   inflammation, cancer, nervous system diseases and infection by pathogenic
CC   microorganism. The method is also useful in forensic investigations and
CC   paternity analysis. The present sequence represents a PCR primer specific
CC   for a human SNP containing DNA sequence

CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

PT New zinc finger-containing proteins and nucleic acids, useful in
PT manufacturing a medicament for treating or preventing a disorder
PT associated with decreased or increased expression or activity of MDZ3,
PT MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS Example 8; SEQ ID NO 5256; 103pp; English.
XX
CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to

XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to

PT   sequence.
XX
PS   Example 4; Page 49; 72pp; English.
XX
CC   The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide
CC   AGT02014. This is one of a set of oligonucleotides (see ABA91527-30) used
CC   to assess the minimum number of ribonucleotides in DNA-RNA chimeric
CC   oligonucleotides required for RNase H cleavage. Each oligonucleotide of
CC   the set had a different number of ribonucleotides, 1 in the present case.
CC   The oligonucleotides were mixed with target DNA oligonucleotide AGT02009
CC   (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30
CC   minutes. The results showed that 4 ribonucleotides were the minimum
CC   number for RNA cleavage. The invention provides probes for nucleic acid
CC   hybridisation. The probes form a hairpin structure comprising a double-
CC   stranded stem and a single-stranded loop, and are capable of both
CC   intramolecular and intermolecular hybridisation. The double-stranded stem
CC   may comprise a methylphosphonate DNA:RNA hybrid that is resistant to
CC   RNase H cleavage. When the probe hybridises with a target DNA, the RNA
CC   strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and
CC   can be removed. Arrays and methods for nucleic acid hybridisation using
CC   the probes are provided

PT and transfected cells.
XX
PS Disclosure; Page 554; 720pp; French.
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT   polypeptide and antibodies.
XX
PS   Disclosure; Page 423; 771pp; French.
XX
CC   The invention relates to the isolation of 6327 nucleotide sequences,
CC   fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC   sequence having at least 80% identity, after optimal alignment, with the
CC   nucleotides, a sequence that hybridizes under stringent conditions with
CC   the nucleotides, or the complement, or corresponding RNA, of the
CC   nucleotides. The nucleotides are used as probes or primers for detecting,
CC   identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC   sense and antisense sequences, of nucleotides involved in tumour
CC   suppression or reversion, apoptosis and or viral resistance, to produce
CC   recombinant polypeptides, and to prepare transgenic animals, as
CC   experimental models. The nucleotides (also vectors containing them and
CC   cells containing the vectors), the encoded polypeptides and antibodies
CC   (Ab) against the polypeptide are useful for prevention and/or treatment
CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 11; Page 64; 77pp; English.
XX
CC   The sequence depicts a HUMNFR (tumour necrosis factor receptor) mRNA
CC   sequence beginning at nucleotide 2354. The sequence is a viral duplex
CC   sequence contg. a purine-rich region concentrated on one chain of the
CC   duplex. The sequence may be prepd. by standard DNA synthesis. The HUMNFR
CC   duplex sequence is used as a target for novel oligomers which are capable
CC   of forming a triplex at physiological pH by coupling into the major
CC   groove of the DNA duplex. Three such oligomers TNFR 941-32 are capable of
CC   forming a triplex with this sequence. The oligomers are used in the
CC   treatment of inflammation. Similar oligomers may be used to target viral
CC   DNA duplexes specific for HIV, herpes and other viruses. The triple
CC   helices form under mild conditions thus assays may be carried out without
CC   subjecting the test specimen to harsh conditions. The oligomer is able to
CC   inhibit gene expression, as verified by in vitro systems. See also
CC   AAQ25452-25500 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Identification of mutation(s) in genes of interest - without prior
PT   observation of phenotypic alteration in the mutated organism or cell.
XX
PS   Example 4; Page 41; 66pp; English.
XX
CC   PCR primers AAV16001-18 were used to identify mutations in Sox-3 using
CC   the method of the invention. The primers are located throughout the gene
CC   and are unique to Sox-3. The method comprises testing a nucleic acid
CC   sample from a mutated organism for a mutation in a gene of interest
CC   without the prior observation of a phenotypic alteration in the mutated
CC   organism resulting from the mutation. Sox-3 is a member of the Sox gene
CC   family, a family of about 20 genes which all encode a "HMG" box, which is
CC   a DNA-binding domain. Mice were mutagenised using ENU mutagenesis. The
CC   mutagenised mice were tested by PCR with each primer set and fluorescent
CC   single strand conformation polymorphism (SSCP), which identifies mice
CC   carrying mutations in Sox-3. The method provides mutational screening
CC   based on genomic and genetic techniques rather than on phenotypic
CC   observation. The method identifies and characterises genes via
CC   mutagenesis to identify genes encoding products which may have
CC   therapeutic benefit. The method also identifies the presence of mutations
CC   in a gene which do not rely solely upon prior matching of a gene with a
CC   disease. Heterozygotic organisms can also be screened to identify those
CC   carrying a mutation in a copy of a gene of interest even though the gene
CC   may be recessive and therefore causes no phenotypic alteration

PT   Identifying a mutation in a gene of interest in an organism useful for
PT   identifying genes encoding products which may have therapeutic benefits.
XX
PS   Example 5; Col 65-66; 70pp; English.
XX
CC   This invention describes a novel mutational screening method based on
CC   genomic and genetic techniques to identify and characterize a mutation in
CC   a gene of interest without first selecting a phenotypic characteristic.
CC   The screening methods are useful for identifying genes encoding products
CC   which may have therapeutic benefit for treating human or animal diseases.
CC   The method can be used for the DNA mutation screening of a class or a
CC   family of genes providing a rapid assay for identifying mutant genes. The
CC   methods produce organisms which can be used for drug discovery e.g.
CC   providing a model for the study and treatment of a disease state, allow
```

CC in vitro assessment of drug activity and interbreeding of mutants which
CC allow investigation of gene interactions in the overall phenotype. A
CC range of phenotypes associated with different mutations, and specified
CC mutations in a gene of interest can be determined. The method can be
CC adapted to screen for a mutation in two or more genes of interest in an
CC organism. The methods allow mutations in a gene of interest to be
CC identified without having to rely on matching a gene with a disease.
CC AAZ43260-Z43421 represent PCR primers used in the method of the invention

PT Detecting mutations in selected genes, useful e.g. for identifying
PT therapeutic targets or products, by analyzing DNA in mutated embryonic
PT stem cells without phenotypic characterization.
XX
PS Example 5; Col 31; 66pp; English.
XX
CC PCR primers AAA05245-A05406 are used to generate amplimers from the mouse
CC Sox-3 gene, Sox-2 gene, T gene, tyrosinase gene, Tryp-1 gene, Sry gene,
CC MGF (mast cell growth factor) gene, c-kit gene, and the Pax-6 gene. The
CC primers are used in a method for the identification of a mutation in a
CC selected gene in a tissue without the prior observation of a phenotypic
CC alteration in the mutated organism or cell. The method is used to
CC identify mutations in a selected gene that encode products of potential
CC therapeutic activity or that are potential targets, particularly where
CC the gene of interest has been identified as a candidate gene by
CC positional cloning. Other applications are determining functions of genes
CC ; detecting the range of phenotypes associated with different mutations
CC in a particular gene and identification of particular mutations. Animals
CC containing an identified mutation are used as models for studying
CC diseases or their treatment, and cells from them for in vitro assessment
CC of drug action. Interbreeding of mutant mice is used to investigate
CC genetic interaction in the overall phenotype

PT New antisense oligonucleotides to metabotropic glutamate receptor type 1
PT gene, which specifically hybridize to mRNA expressed from the gene useful
PT for treating disorders related to elevated glutamate level such as pain.
XX
PS Claim 2; Page 18; 97pp; English.
XX
CC The present invention relates to an antisense oligonucleotide derived
CC from the sequence of metabotropic glutamate receptor type 1 (mGluR1)
CC gene. The antisense oligonucleotide binds to a portion of mRNA expressed
CC from the gene or its splice variant. The binding of the oligonucleotide
CC to the mRNA is effective in decreasing the translation of the mRNA in a
CC host cell expressing the gene. The oligonucleotides are useful for
CC treating chronic pain caused by injury or inflammation of a nerve caused
CC by arthritis. The oligonucleotides may be used with an opioid analgesic.
CC They are also useful for minimizing glutamate neurotoxicity and/or
CC excitotoxicity associated with stroke, ischemia, CNS trauma,
CC neurodegenerative disorders, gastrointestinal disorders or to inhibit
CC tumour formation

PT   Complete sequence of human lectoferritin gene and its regulatory element.
XX
PS   Example 2; Page 18 (Disclosure); 0pp; Chinese.
XX
CC   The invention relates to the complete sequence of the human lactoferrin
CC   (Lf) gene (ACF36873), comprising a part of the regulatory region and all
CC   exons and introns. The lactoferrin gene is located on chromosome 3q21-23.
CC   The lactoferrin gene can be used in the recombinant preparation of human
CC   lactoferrin by a eukaryotic expression system, and in the regulation of
CC   expression of the lactoprotein gene. It may also be used in screening for
CC   genetic markers associated with resistance to disease, and is useful in
CC   the generation of a transgenic animal, and in gene therapy. Sequences
CC   ACF36833-ACF36872 represent PCR primers used in an example from the
CC   invention to amplify the human lactoferrin gene

PS Claim 18; SEQ ID NO 723; 233pp; English.
XX
CC The present invention describes an isolated nucleic acid (I) comprising a
CC single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of
CC Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;
CC and (ii) a nucleic acid having nucleotide sequence that hybridises to
CC (i), or its complement under highly stringent hybridisation conditions.
CC Also described: (1) an isolated oligonucleotide (II) comprising at least
CC 17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O.
CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC polymorphic sites and seabass polymorphic sites, or their complement; (2)
CC a primer pair (III) suitable for use in PCR, comprising two (II) capable
CC of amplifying a nucleotide sequence chosen from S. salar SNPs and, O.
CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC polymorphic sites and seabass polymorphic sites; and determining (M1) the
CC origin of fish sample comprising providing a parentage genotype database
CC comprising a collection of candidate parent genotypes, where each of the
CC candidate parent genotype represents a distinct origin, and comparing a
CC sample genotype to the parentage genotype database, where a match between
CC the sample genotype and one of the candidate parent genotype identifies
CC to the origin of the sample. (M1) is useful for determining the origin of
CC a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus,
CC rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for
CC detecting nucleic acid molecule comprising SNP in a sample, which
CC involves contacting the sample containing nucleic acids with one or more
CC (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus
CC SNPs, and identifying nucleic acid that hybridises to (II). (II) is
CC useful for detecting nucleic acid molecule comprising a polymorphic
CC sequence in a sample, comprising contacting the sample containing nucleic
CC acids with one or more (II) which is derived from O. niloticus
CC microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic
CC sites or seabass polymorphic sites, and identifying a nucleic acid that
CC hybridises to (II). (III) is useful for detecting nucleic acid molecule
CC comprising a microsatellite sequence in sample. The present sequence is
CC used in the exemplification of the present invention.

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Claim 15; SEQ ID NO 678; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Treatment of airway diseases such as asthma - by topically applying
PT   adenosine-free antisense oligo:nucleotide to airway epithelium of
PT   subject.
XX
PS   Claim 5; Page 26; 71pp; English.
XX
CC   A method for treating airway disease in a subject has been produced,
CC   which involves the topical administration of an essentially adenosine
CC   free antisense oligonucleotide (ON) to the airway epithelium of the
CC   subject. The present sequence is an antisense oligonucleotide HUMHDCAS4
CC   specific for the human histidine decarboxylase. The method can be used to
CC   treat airway diseases such as cystic fibrosis, asthma, chronic
CC   obstructive pulmonary disease, bronchitis and other airway diseases
CC   characterised by an inflammatory response. By eliminating adenosine from
CC   the antisense ON, its liberation upon antisense degradation is prevented,
CC   thereby preventing adenosine- induced bronchoconstriction in patients
CC   with hyper-reactive airways

PT   New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT   vasoconstriction.
XX
PS   Disclosure; Page 45; 120pp; English.
XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Claim 18; Page 395; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 141; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   Vaccinating against tumors, infectious diseases, allergies and asthma
PT   using immunostimulatory Py-rich and TG nucleic acids.
XX
PS   Claim 101; Page 46; 338pp; English.
XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT New variants of calcium/calmodulin-dependent protein kinase-like nucleic
PT acids and polypeptides, useful for diagnosing and treating
PT neuropsychiatric disorders, e.g. schizophrenia, schizoaffective disorder,
PT and bipolar disorder.
XX
PS Claim 17; Page 98; 223pp; English.
XX
CC The invention relates to a nucleic acid comprising a polymorphic region
CC of a Calcium/Calmodulin-dependent protein kinase-like gene (CADPKL)
CC allelic variant, and the polypeptide it encodes. CADPKL allelic variants
CC are useful in determining whether a subject has or is at risk of
CC developing a neuropsychiatric disorder, such as schizophrenia, attention
CC deficit disorder (ADD), schizoaffective disorder, bipolar disorder,
CC unipolar affective disorder and adolescent conduct disorder. The
CC polypeptides, polynucleotides, antibodies and modulators of the CADPKL
CC allelic variants are useful for diagnosing or treating these
CC neuropsychiatric disorders. The polypeptides may be used to raise
CC antibodies to a CADPKL polypeptide. The nucleic acids may be used as
CC probes or primers, in pharmacogenomics for designing therapies for the
CC disorders, and in fingerprinting for detection of different individuals
CC with the same species (e.g. paternity testing). This sequence represents
CC a PCR primer used to amplify human CADPKL DNA of the invention

PT Designing capture oligonucleotide probes for use on a support to which
PT complementary oligonucleotides hybridize with little mismatch.
XX
PS Example 5; Fig 29; 300pp; English.
XX
CC The present invention describes a method (M1) for designing capture
CC oligonucleotide probes (I) for use on a support to which complementary
CC oligonucleotide probes (II) will hybridise with little mismatch, where
CC (I) have melting temperatures within a narrow range. The method is useful
CC for detecting infectious diseases caused by bacterial infectious agents
CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
CC Epstein-Barr virus and polio virus, and parasitic infectious agents
CC selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus
CC medinesis. The method is also useful for detecting genetic diseases such
CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
CC involved in DNA amplification, replication, recombination or repair, the
CC cancer is specifically associated with a gene selected from BRCA1 gene,
CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
CC method is also used for environmental monitoring, forensics and the food
CC and feed industry, detecting comprises scanning (using e.g. a scanning
CC electron microscope and infrared microscope) the support at the
CC particular sites and identifying if ligation of the oligonucleotide probe
CC sets occurred and correlating (using a computer) identified ligation to a
CC presence or absence of the target nucleotide sequences. ABI82074 to
CC ABI97546 represent oligonucleotide sequences used in the exemplification
CC of the present invention

PT Method for stabilizing and storing reaction reagents for specific
PT amplification and detection of nucleic acids particularly in e.g.
PT identifying pathogenic microorganisms or viruses in sample.
XX
PS Example 15; Page 121; 177pp; Japanese.
XX
CC The invention relates to a novel stabilising reaction reagent for use in
CC the amplification and/or detection of a target nucleic acid comprising:
CC preparing a reaction mixture with e.g. a nucleic acid as template, at
CC least 1 primer and RNaseH; and incubation of the reaction mixture for a
CC defined period of time to form a reaction product during the
CC amplification of such target nucleic acid. The method is useful for
CC stabilising and long-term storage of reaction reagents for highly
CC sensitive and specific amplification and detection of nucleic acids
CC particularly in identifying pathogenic microorganisms or viruses in a
CC sample using chimeric oligonucleotide primers, which is useful in genetic
CC engineering and clinical medicine. This polynucleotide sequence
CC represents an oligo relating to the novel stabilising reaction reagent

CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   New antisense oligonucleotides for modulating insulin-like growth factor
PT   binding protein 5 gene expression, useful for preventing or treating
PT   cancers, inflammatory disorders, developmental disorders or metabolic
PT   disorders.
XX
PS   Claim 3; Page 75; 105pp; English.
XX
CC   Sequences ACC47637-ACC47667 represent phosphorothioate antisense
CC   oligonucleotides targeted to the human insulin-like growth factor binding
CC   protein 5 (IGFBP5) gene, which inhibit its expression. The antisense
CC   oligonucleotides were designed to target different regions of human
CC   IGFBP5 RNA, and were analysed for their effect on IGFBP5 expression by
CC   quantitative real-time PCR. IGFBP5 (also known as IBP5) is a member of
CC   the insulin-like growth factor superfamily, which are involved in the
CC   regulation of IGF action and bioavailablity, and which also mediate IGF-
CC   independent actions, including inhibition or enhancement of apoptosis.
```

```
CC   IGFBP5 is a key component of the IGF system in bone, having a high
CC   specific binding affinity for hydroxyapatite and extracellular matrix
CC   proteins, and appears to act as a growth factor, stimulating bone
CC   formation via an IGF-independent mechanism. IGFBP5 is also expressed in
CC   other tissues, such as kidney, liver, gut endothelium, lung tubules and
CC   mesenchyme, meninges, notochord, muscle and tongue. Its levels are also
CC   increased in inflamed colon smooth muscle cells in an experimental model
CC   of colitis. It is also thought to play a role in prostate cancer
CC   progression, is expressed with high frequency in neuroendocrine tumours,
CC   and has been shown to be induced in breast cancer cells upon treatment
CC   with antioestrogens used to abolish tamoxifen resistant proliferation.
CC   The oligonucleotides of the invention are useful for diagnosis,
CC   prevention and treatment of IGFBP5-related disorders, such as
CC   hyperproliferative disorders (particularly cancers of the breast,
CC   prostate, pancreas or neuroendocrine system), inflammatory disorders
CC   (e.g., colitis), developmental or growth disorders (e.g., Duchenne
CC   muscular dystrophy), or metabolic disorders (e.g., diabetes,
CC   osteoporosis, or osteopetrosis)

PT   disease by administering an immunostimulatory nucleic acid.
XX
PS   Disclosure; Page 20; 229pp; English.
XX
CC   The invention describes a method of treating non-allergic inflammatory
CC   disease comprising administering to a subject having or at risk of
CC   developing a non-allergic inflammatory disease an immunostimulatory
CC   nucleic acid for prevention or treatment of the disease. The method is
CC   useful for treating non-allergic inflammatory diseases, such as
CC   psoriasis, eczema, allergic contact dermatitis, latex dermatitis or
CC   inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease.
CC   This sequence represents an immunostimulatory nucleic acid

PT   Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT   nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT   and template and primer which do not form a stable duplex in the absence
PT   of HCV NS5B.
XX
PS   Example; Page 6; 17pp; English.
XX
CC   The invention relates to a replicase complex comprising a hepatitis C
CC   virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC   complementary nucleic acid primer which is annealed to the 3' terminus of
CC   the template, where the template is at least three nucleotides and the
CC   primer is two or three nucleotides, and the template and primer do not
CC   form a stable duplex in solution in the absence of the HCV NS5B protein.
CC   The complex is useful for detecting HCV replicase activity and permits
CC   establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC   and evaluate antiviral inhibitors and to improve the specificity and
CC   efficacy of the inhibitors. The complex is also useful in the development
CC   of a reliable system for determining kinetic and thermodynamic constants
CC   of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC   mechanistic inhibitors for mis-incorporation or chain termination.
CC   Specifically, the short RNA template and primer pairs are useful in
CC   screening assays which are used for determining kinetic, thermodynamic
CC   and mechanistic properties of NS5B replication and ultimately in the
CC   development of inhibitors of NS5B. Newly identified inhibitors of
CC   replicase activity may be used for developing anti-HCV pharmaceuticals.
CC   Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC   templates

CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent

PT   ischemic reperfusion.
XX
PS   Example 1; Col 17; 34pp; English.
XX
CC   The present invention describes a method for the inhibition or
CC   minimisation of myocardial injury associated with post-ischaemic
CC   reperfusion by administering factor VII, which has at least 1
CC   modification in its catalytic triad (therefore inhibiting the ability of
CC   factor VII to activate plasma factor X or IX). The method can be used for
CC   inhibiting or minimising myocardial injury and for imparting regional
CC   myocardial blood flow associated with post-ischaemic reperfusion. It can
CC   also be used for inhibiting blood coagulation, platelet deposition,
CC   thrombus formation and maintaining or improving vascular potency. Factor
CC   VII can be administered at relatively low doses and does not produce
CC   undesirable side effects. Further it acts specifically at sites of
CC   injury. The present sequence represents a primer used in the mutagenesis
CC   of Factor VII

XX
CC   This invention relates to 59 human secreted proteins and the nucleotide
CC   sequences encoding them. Sequences AAC59788-C59846 and AAB34687-B34745
CC   represent the proteins and their encoding nucleotide sequences, and
CC   sequences AAB34746-B34771 represent fragments of the proteins. Probes for
CC   the DNA sequences are represented by sequences AAC59847-C59596. The
CC   proteins exhibit neuroprotective, dermatological, immunosuppressive,
CC   antiinflammatory, antianaemic, nootropic, antiparkinsonian,
CC   cerebroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic,
CC   antibacterial, virucide, and fungicide activity. The proteins and
CC   nucleotide sequences are useful as nutritional sources or supplements and
CC   in research. The proteins are useful for treating immune deficiency and
CC   disorders, which may be genetic or resulting from infections, autoimmune
CC   disorders such as multiple sclerosis, systemic lupus erythmatosus,
CC   rheumatoid arthritis, and for treating myeloid or lymphoid cell
CC   deficiencies such as anaemias by regulating haematopoiesis. The proteins
CC   are also useful in compositions for bone, cartilage, tendon, ligament
CC   and/or nerve tissue growth or regeneration, for wound healing, tissue
CC   repair and replacement and in the treatment of wounds, incisions and
CC   ulcers. Other uses include in the treatment of central and peripheral
CC   nervous system and neuropathies such as Alzheimer's and Parkinson's
CC   diseases and Shy-Drager syndrome, and mechanical and traumatic disorders,
CC   such as spinal cord disorders, head trauma and stroke. The proteins may
CC   also be used as a contraceptive, and for treating coagulation disorders
CC   such as haemophilias. The protein and nucleotide sequences with cadherin
CC   activity are useful for treating cancer. Other uses for the protein
CC   include for inhibiting the growth, infection or function of, or killing,
CC   infectious agents such as bacteria, virus, fungi and other parasites, for
CC   effecting bodily characteristics such as height, weight, hair colour,
CC   effecting biorhythms or cardiac cycles or rhythms, effecting metabolism,
CC   catabolism, anabolism, processing, utilization, storage or elimination of
CC   dietary fat, lipid, protein, carbohydrate, vitamins, minerals, cofactors,
CC   effecting behavioural characteristics, providing analgesic effects and
CC   for treating hyperproliferative disorders such as psoriasis

PT   Use of modified human factor VIIa with a covalent modification in its
PT   catalytic center, to inhibit thrombus formation or to maintain vascular
PT   patency.
XX
PS   Example 1; Col 17; 34pp; English.
XX
```

```
CC   The invention relates to the use of modified human Factor VIIa for
CC   inhibiting thrombus formation, or maintaining or improving vascular
CC   patency in a patient. The modified factor VIIa comprises a covalent
CC   modification in its catalytic center which effectively interrupts the
CC   blood coagulation cascade. The modifications render Factor VIIa
CC   substantially unable to activate plasma factor IX or X. The modified
CC   Factor VIIa can be used for preventing or treating myocardial injury
CC   associated with post-ischemic reperfusion, for improving regional
CC   myocardial blood flow during reperfusion and maintaining or improving
CC   vascular patency in a patient. The present sequence represents a
CC   mutagenic oligo used for generating a Ser344Ala Factor VII active site
CC   mutant

PT   Isolated nucleic acid molecules having polymorphisms in known human genes
PT   e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT   for locating, identifying and characterizing the genes responsible for
PT   disorder-related traits.
XX
PS   Example 13; Page 124; 714pp; English.
XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a
CC   sequencing primer used to sequence the polymorphic genes of the invention

PT Amplifying nucleic acid by synthesizing template nucleic acid containing
PT a predetermined sequence and hairpin structure and using the template for
PT target amplification by Single Primer Amplification.
XX
PS Example 4; Page 27; 54pp; English.
XX
CC The invention relates to a method for amplifying a nucleic acid using
CC Single Primer Amplification (SPA). The method comprises synthesising a
CC template nucleic acid containing a predetermined sequence and hairpin
CC structure with the nested oligonucleotide extension reaction. The method
CC is useful for amplifying a nucleic acid, preferably for amplifying a
CC family of related nucleic acid sequences to build a complex library of
CC polypeptides encoded by the sequences. The engineered nucleic acid strand
CC is useful for amplifying a nucleic acid strand by providing a nucleic
CC acid with a predetermined sequence engineered onto its first end, a
CC sequence complementary to the predetermined sequence and a hairpin
CC structure between them and contacting the engineered nucleic acid strand
CC with a primer containing at least a portion of the predetermined
CC sequence. This process is done in the presence of a polymerase and
CC nucleotides under conditions suitable for polymerisation to produce a
CC complementary nucleic acid strand. The method of the invention is useful
CC for producing large amounts of a target nucleic acid sequence and for
CC amplifying simultaneously more than one different target nucleic acid
CC sequence located on the same or different nucleic acid molecules. This
CC polynucleotide sequence represents an oligonucleotide relating to the
CC invention

PT   Method for stabilizing and storing reaction reagents for specific
PT   amplification and detection of nucleic acids particularly in e.g.
PT   identifying pathogenic microorganisms or viruses in sample.
XX
PS   Example 15; Page 121; 177pp; Japanese.
XX
CC   The invention relates to a novel stabilising reaction reagent for use in
CC   the amplification and/or detection of a target nucleic acid comprising:
CC   preparing a reaction mixture with e.g. a nucleic acid as template, at
CC   least 1 primer and RNaseH; and incubation of the reaction mixture for a
CC   defined period of time to form a reaction product during the
CC   amplification of such target nucleic acid. The method is useful for
CC   stabilising and long-term storage of reaction reagents for highly
CC   sensitive and specific amplification and detection of nucleic acids
CC   particularly in identifying pathogenic microorganisms or viruses in a
CC   sample using chimeric oligonucleotide primers, which is useful in genetic
CC   engineering and clinical medicine. This polynucleotide sequence
CC   represents an oligo relating to the novel stabilising reaction reagent
CC   method of the invention

PT   Identifying, isolating and regulating senescence-related genes - useful
PT   to ameliorate problems associated with accumulation of senescent cells,
PT   e.g. age-related lipofuscin accumulation in the retina and AIDS.
XX
PS   Claim 6; Page 25; 135pp; English.
XX
CC   AAT28044-T28075 represent primers for human fibroblasts in enhanced
CC   differential display (EDD), which is used in conjuncture with the method
CC   of the invention. EDD is an mRNA preparation method. AAT28044-T28055
CC   represent T-rich 3'-primers, while AAT28056-T28075 are randomly selected
CC   5'-primers used in EDD of human fibroblasts. The 3'-primers used are
CC   complementary to the poly-A tail of the mRNA. In the method of the
CC   invention, mRNA is isolated from a senescent cell, and a young quiescent
CC   cell, and the mRNAs are amplified in separate reaction mixtures. The
CC   amplified sequences are then separated by size or charge, and the
CC   products are analysed to identify a gene from young quiescent cells and
CC   dividing cells, that is present at a different level from senescent
CC   cells. The method can be used for the rapid and efficient identification
CC   and isolation of senescence-related genes and gene products, and to
CC   detect and distinguish between senescent and non-senescent cells. It can
CC   also be used to destroy cells expressing senescence specific (or related)
CC   gene products, and to screen for compounds capable of altering gene
CC   expression in senescent cells. The method can also be used to ameliorate
CC   problems associated with the accumulation of senescent cells such as age-
CC   related lipofuscin accumulation in the retina, and in the treatment of
CC   AIDS. Also, the method can be used to distinguish young cells from
CC   senescent cells in donor tissue, which is useful in removing senescent
CC   melanocytes overexpressing melanin which cause hypopigmentation, or liver
CC   spots

PS   Claim 9; Col 15; 15pp; English.
XX
CC   An improved method of Differential Display, named Enhanced Differential
CC   Display (EDD) has been designed as a technique for screening differences
CC   in gene expression between various cell types or between different stages
CC   of cell development. The technique is highly reproducible, leading to
CC   precise typing of the expressed genes in any given cell. EDD analysis
CC   permits the identification of novel genes involved in differentiation,
CC   aging and disease, and enables direct comparisons of different cell types
CC   and disease states. By using longer primers, and/or an alteration in the
CC   annealing temperatures, the number of false positives can be reduced.
CC   First, cDNA is prepared from total cellular RNA using 12 different 22-
CC   base oligonucleotides (AAT58484-95) that are targeted to the poly A tail
CC   of pol II mRNA transcripts. The last two bases of each primer varies so
CC   as to anchor the primer to the 3' end of different sets of mRNAs. A
CC   second set of 12 22-base oligo primers (AAT58472-83) is designed to
CC   randomly select a subset of cDNAs from each of the twelve 3' primers. PCR
CC   amplification of a subset of cDNAs is carried out in a two step process
CC   using particular 5' and 3' primers. The amplified gene products can then
CC   be directly sequenced or rapidly subcloned for DNA sequencing

PT   New isolated Aspergillus oryzae signaling sequences, used to increase the
PT   production of polypeptides by recombinant host filamentous fungal cells.
XX
PS   Example 2; Page 35; 78pp; English.
XX
CC   Sequences AAZ47342-Z47353 are oligo(dT12N2) primers used in the
CC   differential display analysis of the Aspergillus oryzae strains HC4.01
CC   and 27. The strains were analysed to find the genetic basis for phenotype
CC   differences in the strains which are used in a method for producing a
CC   polypeptide in an enhanced amount. The method involves cultivating a
CC   mutant of a parent filamentous fungal cell in suitable nutrient medium.
CC   The mutant cell contains the nucleotide sequence encoding the polypeptide
CC   to be synthesised and one or more second nucleotide sequences encoding a
CC   DDC polypeptide (see AAZ47338-Z47339). The mutant cell produces more of
CC   the polypeptide than the parent cell and the polypeptide can be recovered
CC   from the nutrient medium of the mutant cell. The method can be used for
CC   the production of polypeptides such as hormones, receptors, antibodies,
CC   reporters or enzymes, e.g. an aminopeptidase, amylase, carbohydrase,
CC   carboxypeptidase, catalase, cellulase, chitinase, cutinase, cyclodextrin
CC   glycosyltransferase, deoxyribonuclease, esterase, alpha-galactosidase,
CC   beta-galactosidase, glucoamylase, alpha-glucosidase, beta-glucosidase,

PT   Gene diagnosis of bovine Chediak-Higashi syndrome.
XX
PS   Example 1; Page 8; 21pp; Japanese.
XX
CC   This invention relates to a reagent used in a method for the genetic
CC   diagnosis of bovine Chediak-Higashi syndrome (CH-S). The reagent contains
CC   a restriction enzyme Fok I or its isoschizomer and is used for the
CC   detection of the presence or absence of a mutation site in the bovine
CC   Lyst gene. The Lyst gene encodes a lysosomal traffic regulator protein.
CC   The invention includes a kit for the detection of bovine CH-S and a
CC   method for the genetic diagnosis of CH-S. The method is used for the
CC   rapid detection of bovine CH-S and its carrier. The present sequence
CC   represents a bovine Lyst gene PCR primer used in the method of the
CC   invention

PT   Genetic diagnosis of bovine Chediak-Higashi syndrome.
XX
PS   Example 1; Page 7; 23pp; Japanese.
XX
CC   The present invention describes a method for the genetic diagnosis of
CC   bovine Chediak-Higashi syndrome (CH-S). The method comprises getting a
CC   bovine nucleic acid sample, subjecting it to a gene amplifying reaction
CC   and examining the mutation on the nucleic acid fragment. The method can
CC   be used for an easy rapid detection of bovine CH-S and its carrier. The
CC   present sequence represents a PCR primer for the bovine lysosomal traffic
CC   regulator (Lyst) gene nucleotide sequence, which is related to CH-S

PT New isolated NOVX polypeptides and nucleic acid molecules useful for
PT treating, preventing and diagnosing pathological conditions with NOVX-
PT associated disorders, such as cancer, obesity, diabetes and inflammatory
PT or CNS diseases.
XX
PS Example B; SEQ ID NO 264; 772pp; English.
XX
CC The invention relates to novel isolated polypeptides, mature form of the
CC polypeptide, a sequence that is 95% identical to the polypeptide or the
CC polypeptide comprising one or more conservative substitutions. The NOVX
CC polypeptide is useful for treating or preventing a pathology associated
CC with the polypeptide e.g. disorders associated with aberrant expression
CC or activity of the polypeptide, such as cancer, diabetes, obesity, and
CC endocrine, CNS and inflammatory disorders. They can also be used in
CC various detection and screening assays, chromosome mapping, tissue typing
CC and predictive medicine. This sequence corresponds to a primer used to
CC amplify and isolate the coding sequence for one of the polypeptides of
CC the invention.

PT New non-steroidal anti-inflammatory drug activated gene with anti-
PT tumorigenic properties, useful in drug screening, particularly for
PT identifying and characterizing agents or compounds having anti-cancer
PT properties.
XX
PS Example 1; Page 34; 67pp; English.
XX
CC The present invention describes an isolated and purified non-steroidal
CC anti-inflammatory drug activated gene (NSAID associated gene, also
CC designated NAG-1), which comprises a 8902 base pair sequence (I). (I) has
CC cytostatic activity. (I) is useful in drug screening, particularly for
CC identifying and characterising agents that are agonistic or antagonistic
CC to the activation of the promoter region of the NAG-1 gene, the
CC activation of which is correlated with the apoptotic elimination of
CC certain cancers. In particular, the DNA is useful for identifying
CC compounds having anti-cancer properties. NAG-1 peptides encoded by (I)
CC are useful for treating cancer. The NAG-1 gene given in the present
CC invention, having Genbank accession number AF019770, is designated as
CC human macrophage inhibitory cytokine-1 (MIC-1). The present sequence
CC represents a PCR primer for a human NSAID regulated gene designated
CC INDO29, which is used in an example from the present invention

PT Typing at least two variable sites of at least one nucleic acid molecule
PT related to cystic fibrosis by simultaneously or sequentially performing
PT primer extension reactions and determining the pattern of nucleotide
PT incorporation.
XX
PS Example 2; Page 29; 69pp; English.
XX
CC The present invention describes a method for typing at least two variable
CC sites of at least one nucleic acid molecule related to cystic fibrosis.
CC The method comprises: (a) providing at least one nucleic acid molecule of
CC a gene related to cystic fibrosis; (b) providing at least one extension
CC primer, which binds to different predetermined sites in the nucleic acid
CC molecules, where at least one extension primer is designed to extend over
CC at least two potential variable sites in the nucleic acid molecule, and
CC nucleotide; (c) simultaneously or sequentially performing primer
CC extension reactions; and (d) determining the pattern of nucleotide
CC incorporation to obtain a test pattern; optionally (e) comparing the test
CC pattern of step (c) with one or more reference patterns, in order to type
CC the variable sites of the nucleic acid molecules. Also described: (1)
CC diagnosing the genetic predisposition of states, diseases and drug
CC response related to the human cystic fibrosis transmembrane conductance
CC regulator (CFTR) gene; and (2) a kit for use in the method for typing
CC comprising at least one extension primer. The method is useful for typing
CC at least two variable sites of at least one nucleic acid molecule related
CC to cystic fibrosis. The present sequence represents a PCR primer for
CC human CFTR, which is used in the exemplification of the present
CC invention.

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 5; Page 33; 62pp; English.
XX
CC   The present sequence is an oligonucleotide probe that was used in a
CC   molecular beacon in an example from the invention. The probe forms a
CC   hairpin structure in the native state. The 5' end of the probe is
CC   covalently joined via a linker to a disulfide or primary amine. The 3'
CC   end of the probe is covalently joined to an amine-reactive fluorescent
CC   dye such as fluorescein. A gold surface or other metal film surface is
CC   attached to the disulfide or amine group to form the molecular beacon. In
CC   the native state with hybridised termini, the proximity of the
CC   fluorophore and quencher (gold surface) in the molecular beacon is such
CC   that little or no fluorescence is detectable. Upon hybridisation of the
CC   central complementary stretch of the probe to a target sequence (e.g. the
CC   sequence in ABL57070), the hairpin undergoes a conformational change
CC   resulting in an increase in fluorescence, the extent of which is
CC   proportional to the amount of binding partner present. The invention
CC   relates generally to the use of metal surface quenchers such as particles
CC   or films for high sensitivity applications in, for example, detection and
CC   diagnostic systems

PT Novel human UDP-glucuronosyltransferase sequence, polymorphisms for
PT genotyping individuals to predict rate of metabolism of substrates and
PT for identifying potential drug interactions.
XX
PS Example 2; Page 22; 72pp; English.
XX
CC This sequence represents a primer used to sequence polymorphic fragments
CC of the human UDP-glucuronosyltransferase 2B7 (UGT2B7) gene. UDP-
CC glucuronosyltransferases (UGTs) are a family of enzymes that catalyse the
CC glucuronic acid conjugation of a wide range of endogenous and exogenous
CC substrates. The UGT2B gene subfamily encode steroid metabolizing isoforms
CC in the liver. Alteration of the expression or function of UGTs may effect
CC drug metabolism. The invention relates to non-chromosomal nucleic acid
CC molecules, which comprise human UGT2B sequence polymorphisms (see
CC AAZ95051-Z95110). Probes which detect the UGT2B locus polymorphisms can
CC be used to detect altered UGT2B metabolism of a substrate in an
CC individual. The nucleic acid molecules comprising a human UGT2B sequence
CC polymorphism can be used in screening assays for genotyping individuals,
CC also to predict their rate of metabolism of UGT2B substrate, potential
CC drug-drug interactions and adverse side effects. The polymorphisms can be
CC used as single nucleotide polymorphisms (SNPs) for detecting genetic
CC linkage related to phenotypic variation in activity or expression of
CC UGT2B protein. The polymorphism containing nucleic acid molecules may
CC also be used for generating genetically modified non-human animals and
CC for obtaining site specific gene modification in cell lines

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 1; Page 22; 62pp; English.
XX
CC   The present sequence is an oligonucleotide probe that was used in a
CC   molecular beacon in examples from the invention. The probe has a hairpin
CC   structure in the native state. The disulfide group at the 5' end of the
CC   probe was covalently linked to the 5' phosphate via a (CH2)6 spacer, and
CC   the primary amino group at the 3' was attached to the 3' hydroxyl via a
CC   (CH2)7 spacer. An amino-reactive dye, such as fluorescein, rhodamine 6G
CC   or Texas Red, was covalently linked to the 3'-amino group. A
CC   monomaleimido-gold nanoparticle was then covalently linked to the 5'
CC   sulfhydryl group to form the molecular beacon. In the native state with
CC   hybridised termini, the proximity of the fluorophore and quencher (gold
CC   nanoparticle) in the molecular beacon is such that little or no
CC   fluorescence is detectable. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence (e.g. the
CC   sequence in ABL57070 or ABL57071), the hairpin undergoes a conformational
CC   change resulting in an increase in fluorescence, the extent of which is
CC   proportional to the amount of binding partner present. Single mismatch
CC   detection was demonstrated. The invention relates generally to the use of
CC   metal surface quenchers such as particles or films for high sensitivity
CC   applications in, for example, detection and diagnostic systems

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 3; Page 30; 62pp; English.
XX
CC   The present sequence is an oligonucleotide probe that was used in a
CC   molecular beacon in an example from the invention. A rhodamine 6G dye was
CC   attached to the primary amine at the 5' end of the oligonucleotide, which
CC   had DABCYL attached to its 3' end. A rhodamine-DNA-gold conjugate
CC   molecular beacon (see ABL57069) was also used. In the native state with
CC   hybridised termini, the proximity of the fluorophore and quencher (gold
CC   nanoparticle) in the molecular beacon is such that little or no
CC   fluorescence is detectable. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, the hairpin
CC   undergoes a conformational change resulting in an increase in
CC   fluorescence, the extent of which is proportional to the amount of
CC   binding partner present. Single mismatch detection was demonstrated. The
CC   invention relates generally to the use of metal surface quenchers such as
CC   particles or films for high sensitivity applications in, for example,
CC   detection and diagnostic systems

XX
PT   Hairpin sensor useful for detecting a target nucleotide sequence in a
PT   sample, comprises a hairpin loop assembly including a complementary probe
PT   and a quenchable fluorescing agent.
XX
PS   Example 2; Page 11; 16pp; English.
XX
CC   The invention discloses a hairpin sensor comprising a hairpin loop
CC   assembly including a complementary probe positioned between a first
CC   inverse repeat arm and a second inverse repeat arm, and a quenchable
CC   fluorescing agent joined, directly or indirectly, to the end of the
CC   second inverse repeat arm of the hairpin loop assembly opposite the
CC   complementary probe. Also claimed is a microarray comprising the hairpin
CC   sensor, where the end of the first inverse repeat arm opposite the
CC   complementary probe is bound, directly or indirectly, to a support, a kit
CC   for detecting a target nucleotide sequence in a sample comprising the
CC   hairpin sensor, and a support, and a hairpin sensor system, in which the
CC   particle is conductive or semi-conductive, including at least one of the
CC   above hairpin sensor assemblies. The hairpin sensor further comprises a
CC   functional group joined to the end of the first inverse repeat arm
CC   opposite the complementary probe, or first spacer opposite the first
CC   inverse repeat arm, the functional group selected from amino, carboxyl,
CC   thiol and hydroxyl. Further, the sensor comprises a ligand positioned
CC   between the second inverse repeat arm and the quenchable fluorescing
CC   agent, where the ligand is selected from mercapto, hydroxyl, amino,
CC   nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The
CC   second spacer is positioned between the second inverse repeat arm and the
CC   quenchable fluorescing agent which comprises a semiconductor nanocrystal
CC   or rhodamine B-labelled dye. Within the microarray the support is capable
CC   of accepting a charge. At least one hairpin sensor comprises two or more
CC   hairpin sensors. The two or more hairpin sensors include complementary
CC   probes that are the same or different and respective quenchable
CC   fluorescing agents that are the same or different. The two or more
CC   hairpin sensors are arranged in a spatially-defined pattern. The sensor
CC   and system are useful for detecting a target nucleotide sequence in a
CC   sample. Further, the method involves identifying the target nucleotide
CC   sequence by the location of the complementary probe to which the target
CC   nucleotide sequence binds. The two or more hairpin sensors include
CC   complementary probes or quenchable fluorescing agents, that are
CC   different. The sequence presented is the hairpin oligonucleotide, #1,
CC   used in an example of the invention.

PT   Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT   sample comprising the complex with ligand that binds to a component of
PT   the complex and separating complex by binding ligand with a binding
PT   molecule.
XX
PS   Example 6; Page 31; 49pp; English.
XX
CC   The specification describes a method for partitioning endogenous cellular
CC   mRNA-protein (mRNP) complexes. The method comprises contacting a
CC   biological sample comprising mRNP complex with ligand that specifically
CC   binds a component of mRNP complex, separating mRNP complex by binding the
CC   ligand with a molecule specific for ligand, which is attached to the
CC   solid support and then collecting the mRNP complex by removing the
CC   complex from the support. The method is useful for in vivo partitioning
CC   of cellular mRNA protein complexes in a biological sample. The method is
CC   useful for determining the ribonomic profile of a cell which has numerous
CC   uses including monitoring of tumour development, state of growth or state
CC   of development, perturbations of a biological system such as disease,
CC   drug or toxin treatment and the state of cell aging or death,
CC   distinguishing ribonomic profiles among organisms, to discriminate
CC   between transcriptional and post-transcriptional contributions to gene
CC   expression and to track the movement of RNAs through RNP complexes,
CC   including the interactions of combinations of proteins with RNAs in RNP
CC   complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC   untranslated region (UTR) of mRNA of various genes. The sequences contain
CC   target sequences for RNA-binding proteins

PT   Judging the genotype of a region around a plant sd-1 gene with
PT   polymorphism-obtained markers isolated by positional cloning, useful in
PT   genotyping for examination of semi-dwarf character of rice.
XX
PS   Disclosure; Page 15; 104pp; Japanese.
XX
CC   The present invention describes a method for judging the genotype of a
CC   region around a plant semi-dwarf (sd-1) gene in which polymorphisms are
CC   present, by detecting the polymorphisms. Also described: (1) examining
CC   semi-dwarf characteristics of a plant using the judgment method with
CC   detection of polymorphisms; (2) oligonucleotides for amplifying sd-1 DNA
CC   regions, which are primers for judging the genotype of a region around a
CC   plant sd-1 gene; (3) reagents for judging the genotype of a region around
CC   a plant sd-1 gene containing these oligonucleotides; and (4) reagents for
CC   examining the semi-dwarf character of a plant containing the
CC   oligonucleotides. The method is for judging the genotype of a region
CC   around a plant sd-1 gene, which is applicable in genotyping by (d)CAPS
CC   ((derived) cleaved amplified polymorphic sequence) for examination of the
CC   semi-dwarf character of rice to identify desirable strains e.g. with high
CC   crop yield, pest resistance and resistance to flooded water. The method
CC   is easy and quick, in which a seedling is required for studying single
CC   nucleotide polymorphisms (SNPs) for genotyping, without needing
CC   cultivation of seedling to fully-grown plant for judging heterozygote and
CC   distinguishing morphology. The present sequence represents a rice sd-1
CC   DNA fragment, which is given in the exemplification of the present
CC   invention. Rice sd-1 is located on chromosome 1.

PT   New C-5 thiol-substituted nucleoside derivatives - whose presence in
PT   oligo:nucleotide(s) allows formation of covalent cross-links between non-
PT   complementary DNA domains.
XX
PS   Example 7; Page 89; 122pp; English.
XX
CC   This sequence represents an oligonucleotide containing a pentanucleotide
CC   loop. The invention relates to C-5 thiol-substituted nucleoside
CC   derivatives which can be incorporated into an RNA or DNA strand during
CC   synthesis of oligonucleotides. These compounds can be in the form of
CC   cross-linked linear, cross-linked hairpin or bridged circular oligo-
CC   nucleotides. The oligonucleotides may be used for detection and isolation
CC   of target nucleic acids, or for targeting drugs to specific cell types
CC   (e.g. for treatment of Alzheimer's disease, beta-thalassemia,
CC   osteogenesis imperfecta, arthritis, sickle cell anaemia or viral
CC   infections). The presence of the nucleoside derivatives in a linear
CC   oligonucleotide allows the formation of covalent crosslinks between non-
CC   complementary DNA domains

PT   Evaluating a cellular response to an environmental compound, for use in
PT   toxicological analysis, involves determining or comparing the expression
PT   levels of at least one endogenous gene.
XX
PS   Claim 29; Page 55; 77pp; English.
XX
CC   The sequence represents a generic downstream PCR primer for use in DDRT-
CC   PCR experiments which demonstrate the method of the invention. The method
CC   relates to evaluating a cellular response to an environmental compound,
CC   comprising determining or comparing the expression levels of at least one
CC   endogenous gene e.g by differential display of reverse transcribed mRNAs
CC   by PCR (DDRT-PCR). The method can be adapted to identify compounds that
CC   act on the level of endogenous gene expression through activating nuclear
CC   receptors. The method is useful in toxicological analysis, diagnostics,
CC   for diagnosing cancer (e.g. testicular, breast, prostate and
CC   endometrium), asthma, hypospadia, cryptorchism and/or allergy, and for
CC   evaluating the efficiency of a treatment for hormonal deficiency or
CC   hormonal replacement therapy, in a human such as a post-menopausal
CC   female. The method is also useful for identifying environmental chemicals
CC   or pharmaceutical compositions that interact with endocrine systems, and
CC   for detecting chemicals that pose a health threat. Expression levels of
CC   endogenous genes are determined rapidly using a sensitive technique, and
CC   the expression of any gene can be monitored. The assays are far more
CC   informative than the currently used assays, and significantly reduces the
CC   number of animals required for the testing, as it is expected that
CC   essentially all the animals in a test group will respond to the compound

PT   Novel probe sets with common universal linkers at one or both ends (WRAP
PT   probes) for gene expression arrays to provide global amplification of
PT   probe set and to provide common equivalent signaling regardless of
PT   length.
XX
PS   Disclosure; Page 88; 97pp; English.
XX
CC   The invention relates to a probe set for gene expression arrays to
CC   provide common equivalent signalling per probe and global amplification
CC   of the set. The probe set has a pool of modified cDNA probes, each probe
CC   having a central target specific segment copied from a portion of a
CC   single mRNA transcript and a universal linker (a WRAP-Probe) located on
CC   one or both terminal ends. The universal linker has reporter binding
CC   sites to join common reporters to the probes and primer binding sites to
CC   copy and amplify the probe. The probes and reporters are useful in
CC   diagnostic or drug discovery assays for a wide range of biomedical
CC   samples, including detection of nucleic acids and gene expression
CC   profiles in human diagnostics, forensics and genomic analysis. The
CC   methods are useful for amplifying and identifying any unknown DNA
CC   fragment and also for improving sensitivity with tissue microarrays or
CC   RNA arrays. The methods improve the quantification of gene expression and
CC   allow highly improved detection of rare transcripts or very small
CC   samples. This sequence represents a poly-T primer used in the
CC   construction of probe sets

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 4121; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Kit for automated genotyping contg. pairs of PCR primers - designed to
PT   amplify polymorphic nucleotide repeat sequences, arranged in sets each
PT   with a characteristic fluorescence label, useful e.g. in detection of
PT   disease related genetic rearrangement.
XX
PS   Claim 4; Fig 7B-2; 104pp; English.
XX
CC   The method aims to provide a collection of highly reproducible
CC   microsatellite marker sequences (MMS) at approx. 10-50 cM intervals
CC   throughout the human genome which can be detectably labelled. The MSS are
CC   polymorphic, simple sequence repeats and can be used in automated
```

```
CC   genotyping, esp. fluorescence-based. The primers correspond to the unique
CC   DNA sequence surrounding each marker, and PCR is used to detect each
CC   polymorphism. When the MSS show considerable polypmorphism (ie. a
CC   difference in the number of repeats) between individuals, the markers can
CC   be particularly informative. The MSS can be ideal for linkage studies.
CC   Kits comprise at least 4 groups, of at least 3 sets, each comprising
CC   labelled primers for PCR amplification of the DNA. Group 2 primer pairs
CC   are shown in AAQ95369-416. The published size range of the IL-9 allele is
CC   271-283 bp, and the degree of heterozygosity in the population is about
CC   63%

PT   Oligo:nucleotide(s) complementary to interleukin-6 receptor mRNA - for
PT   treating proliferative diseases, e.g. cancer, auto-immune diseases or
PT   viral infections.
XX
PS   Claim 1; Page 16; 18pp; English.
XX
CC   AAT50887-T50904 represent oligonucleotides of the invention. These
CC   sequences are all probes for interleukin-6 receptor (IL-6R) mRNA. IL-6 is
CC   one of the most well characterised of the cytokines. It functions through
CC   interacting with at least two transmembrane glycoprotein receptor
CC   molecules on the surface of target cells. The receptors are the IL-6R,
CC   and the signal transducer gp130. Signal transduction by IL-6 involves the
CC   concerted action of both IL-6R and gp130. IL-6 overproduction is
CC   implicated in many different disease states, particularly in cellular
CC   proliferation associated with these diseases. These sequences bind to the
CC   IL-6R coding sequence, thereby inhibiting IL-6R production. The sequences
CC   therefore inhibit the functioning of IL-6. These sequences can be used
CC   for inhibiting disease-associated cellular proliferation. The
CC   oligonucleotides are especially useful for treating cancer (e.g. renal
CC   cell carcinoma), autoimmune diseases or viral infections. They can also
CC   be used as probes for detecting IL-6 receptor mRNA, especially for
CC   evaluating the effectiveness of drugs in reducing IL-6 receptor mRNA
CC   levels

PT   Diagnosis and screening for bovine alpha-mannosidosis - by detecting
PT   mutation(s) in alpha-mannosidase gene, also nucleic acid encoding the
PT   enzyme and derived oligo:nucleotide primers.
XX
PS   Example 2; Page 22; 85pp; English.
XX
CC   Forward primer mp5UT1F is based on a 1500 bp amplicon produced from
CC   bovine fibroblast genomic DNA using primers (see AAT91098-99) based on
CC   the bovine alpha-mannosidase (LAMAN) gene (see AAT91086). It was used
CC   with reverse primer mp262 (see AAT91101) to obtain an 800 bp RT-PCR
CC   product that constituted a 5' part of LAMAN cDNA. This was combined with
CC   a previously obtained PCR cDNA fragment (see AAT91096-97) to produce a
CC   full-length clone (see AAT91086) for LAMAN (see AAW26682). Mutations in
CC   the LAMAN gene cause bovine alpha-mannosidosis, and can be detected using
CC   claimed PCR primers (see AAT91088-93)

PT Haplotype analyses for indirect detection of glaucoma.
XX
PS Claim 7; Page 27; 41pp; English.
XX
CC This sequence represents a PCR primer used in the method of the
CC invention. The method is for detecting the presence of alleles for
CC glaucoma comprising haplotype analysis of human chromosome 2 and 6
CC respectively, where the haplotypes are associated with loci GLC1B and
CC GLC6p25 respectively. The primers are used to amplify gene sequences to
CC generate information necessary to compile haplotype profiles. The
CC haplotype profiles can be used to detect presymptomatic and symptomatic
CC glaucoma. They can also be used to localise, isolate and identify the
CC GLC1B and GLC6p25 loci so that detection of individuals with glaucoma is
CC enhanced. The haplotype analyses also provide means for identification
CC and following of mutant alleles in pedigrees or populations.
CC Identification of presymptomatic individuals using the methods allows
CC intervention in the disease process and obviates the impact of inheriting
CC a mutant allele causing disease, by medically disrupting the initiation
CC or progression of the disease

XX
CC   AAX91991-X97517 represent PCR primers used to amplify open reading frames
CC   and other nucleic acid sequences from the genome of Chlamydia pneumoniae
CC   (see AAX91990). C. pneumoniae causes respiratory disease such as
CC   pneumonia and bronchitis and is thought to be a contributing factor in
CC   heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema
CC   nodosum or pharyngitis. The polypeptides encoded by the open reading
CC   frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used
CC   in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
CC   nucleotides sequences can also be used as immunogenic compositions,
CC   especially where the vector directs the expression of a neutralising
CC   epitope of C. pneumoniae

PT   Identifying humans at risk of, or having indication associated with
PT   altered innate immunity involves detecting or determining whether DNA
PT   amplified from a biological sample encodes a portion of variant toll
PT   receptor 4.
XX
PS   Example 1; Page 31; 97pp; English.
XX
CC   The invention relates to human toll receptor 4 (TLR4) nucleic acid and
CC   methods to identify polymorphisms at the human TLR4 locus and to identify
CC   individuals at risk of, or having, an indication associated with altered
CC   innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic
CC   reagent for detecting a polymorphism in human TLR4 gene. Since the
CC   presence of TLR4 mutation is associated with gram-negative sepsis,
CC   severity of sepsis, pre-term delivery and respiratory distress syndrome
CC   in pre-term infants, agents which alter TLR4 activity are useful for
CC   preventing or ameliorating infection by gram-negative bacteria, sepsis
CC   induced by gram-negative bacteria, LPS (lipopolysaccharide) induced
CC   chronic airway disease, asthma, arthritis, local and systemic
CC   inflammatory disease conditions such as systematic inflammatory response
CC   syndrome (SIRS) or acute respiratory distress syndrome (ARDS),
CC   pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic
CC   obstructive pulmonary disease, local gram-negative bacterial infection
CC   and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for
CC   amplifying the exons of human TLR4 gene

```
CC   The present sequence is an oligonucleotide provided in a specification
CC   relating to the simplified purification of oligonucleotides by liquid
CC   chromatography. The process comprises: (a) pouring oligonucleotides
CC   protected with a hydrophobic group and oligonucleotide with no protective
CC   group into a liquid chromatography column packed with an acid and alkali
CC   resistant packing agent, such as polystyrene resin; (b) pouring a mixed
CC   developing solvent composed of a buffer made from a volatile salt and a
CC   water soluble organic solvent at a suitable concentration gradient into
CC   the column; (c) pouring an acid, particularly 6-16 v/v% acetic acid, into
CC   the column to deprotect the oligonucleotides protected with the
CC   hydrophobic group; (d) pouring a mixed developing solvent composed of a
CC   buffer made from a volatile salt, particularly 0.05-0.5 N aqueous
CC   ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water
CC   soluble organic solvent at a suitable concentration gradient to elute the
CC   deprotected oligonucleotides; and (e) removal of the solvent and the salt
CC   from the eluted oligonucleotides

XX
CC   The present invention relates to antisense compounds, 8-30 nucleobases in
CC   length targeted to the 5' untranslated region, translation termination
CC   codon region, 3' untranslated region, coding region or translation start
CC   site of a nucleic acid encoding human mdm2, where the antisense compound
CC   modulates the expression of human mdm2. The antisense oligonucleotides of
CC   the invention are useful for encoding human mdm2 and for inhibiting the
CC   expression of human mdm2. They may be used for treating an animal having
CC   a disease or condition associated with amplification of mdm2 gene or
CC   overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer
CC   (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis,
CC   fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma
CC   and chronic myelogenous leukemia. The antisense compound may be
CC   administered with a chemotherapeutic agent to overcome drug resistance.
CC   The antisense compound reduces hyperproliferation of human cells. The
CC   method, which involves the use of the antisense compound, is also useful
CC   for detecting the role of mdm2 expression in various cell functions and
CC   physiological processes and useful in both clinical research and
CC   diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
CC   oligonucleotides of the present invention

PT   Predicting the potential of an oligonucleotide to hybridize to a target
PT   nucleotide sequence, useful for evaluating oligonucleotide probe
PT   sequences, by identifying a oligonucleotides based on the evaluation of
PT   parameters.
XX
PS   Example 2; Col 65; 342pp; English.
XX
CC   The present invention describes a method for predicting the potential of
```

```
CC   an oligonucleotide to hybridise to a (complementary) target nucleotide
CC   sequence, involving identifying a subset of oligonucleotides within the
CC   predetermined number of unique oligonucleotides based on the evaluation
CC   of the parameter. Oligonucleotides in the subset are identified that are
CC   clustered along a region of the nucleotide sequence that is hybridisable
CC   to the target nucleotide sequence. This is useful for evaluating
CC   oligonucleotide probe sequences. The present sequence is an
CC   oligonucleotide described in the exemplification of the invention.

PT   Probes for detecting target nucleotide sequence in sample, has sequence
PT   that forms hairpin structure having a double-stranded segment and single-
PT   stranded loop collectively forming region complementary to target
PT   sequence.
XX
PS   Example 5; Page 49; 72pp; English.
XX
CC   The present sequence is that of oligonucleotide AGT02020, which contains
CC   a single mismatch with a target DNA oligonucleotide (see ABA91531). It is
CC   one of a set of oligonucleotides (see ABA91532-37) containing
CC   mismatch(es) to the target DNA that were tested in a hybridisation/RNase
CC   H cleavage assay. The results showed that 2 mismatches between the target
CC   and the probe ablated RNase H cleavage. The effect of one mismatch site
CC   was less than that of two mismatch sites, and showed a polarity effect,
CC   with stronger inhibition shown in assays with AGT02020 than in assays
CC   using an oligonucleotide in which the mismatch was at an adjacent
CC   position. The invention provides probes for nucleic acid hybridisation.
CC   The probes form a hairpin structure comprising a double-stranded stem and
CC   a single-stranded loop, and are capable of both intramolecular and
CC   intermolecular hybridisation. The double-stranded stem may comprise a
CC   methylphosphonate DNA:RNA hybrid that is resistant to RNase H cleavage.
CC   When the probe hybridises with a target DNA, the RNA strand in the
CC   DNA:RNA duplex becomes sensitive to RNase H treatment and can be removed.
CC   Arrays and methods for nucleic acid hybridisation using the probes are
CC   provided

XX
CC   Sequences ABA02205-ABA02282 represent antisense oligonucleotides targeted
CC   to the human CCAAT/enhancer-binding protein alpha (C/EBP alpha) gene,
CC   which inhibit its expression. The antisense oligonucleotides were
CC   designed to target different regions of the human C/EBP alpha RNA, and
CC   were analysed for their effect on C/EBP alpha mRNA levels by quantitative
CC   real-time PCR. A similar investigation on mouse C/EBP alpha expression
CC   was performed using a subset of the antisense oligonucleotides that were
CC   capable of hybridising to mouse C/EBP alpha mRNA. The C/EBP family of
CC   proteins are a family of transcription factors which regulate the
CC   expression of wide range of genes that control normal tissue development,
CC   cellular function, cellular proliferation and functional differentiation.
CC   C/EBP alpha (also known as CEBPA) is primarily found in tissues involved
CC   in energy metabolism which have a capacity to metabolise lipids,
CC   cholesterol and other sterols. It is thought to be involved in the
CC   regulation of adipocyte and chondrogenic differentation, and is also
CC   involved in follicular development and ovulation, steroid-induced cell
CC   cycle arrest in the liver, in controlling glucose transporter GLUT2
CC   promoter activity, in the hormonal regulation of metabolism, and in
CC   granulocyte development. The oligonucleotides of the invention are useful
CC   for diagnosis, prevention and treatment of conditions associated with
CC   C/EBP expression, such as cancer, tumour formation, infection, or
CC   inflammation

PT   Arraying genome clones.
XX
PS   Claim 6; Page 57; 528pp; Japanese.
XX
CC   The present invention describes a method of arraying genome clones. The
CC   method comprises: (a) clones of the genomic libraries contained in
CC   multiwell plates numbered for discrimination are mixed in each of the
CC   multiwell plates; (b) a primer designed based on the chromosome marker
CC   sequence is added to the mixture to carry out an amplification reaction;
CC   (c) a signal corresponding to the marker is detected from the resultant
CC   amplified product to specify the discrimination Nos. of the multiwell
CC   plates containing the clones having said marker sequence; (d) the order
CC   of the markers is changed so that the same discrimination Nos. succeed to
CC   the maximum in the specified discrimination Nos. to array the multiwell
CC   plates; (e) the clones in the multiwell plates of the specified
CC   discrimination Nos. are mixed respectively in each wells of longitudinal
CC   and lateral directions; (f) the mixed clones are cultured and the
CC   resultant cultures are amplified by using the above primer; (g) signals
CC   are detected from the amplified products; (h) the clones in the multiwell
CC   plates are specified from the detected result; and (i) the clones are
CC   reconstituted as the positions on the chromosome and arrayed. The
CC   microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC   PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC   represent PCR primers for human chromosome 21q22.1, which are
CC   specifically claimed for use in the present invention

PT   Novel antisense compound targeted to nucleic acids encoding human or
PT   mouse CCAAT/enhancer binding protein (C/EBP) beta, useful in vitro for
PT   inhibiting expression of human or mouse C/EBP beta in cells/tissues.
XX
PS   Claim 1; Col 42; 69pp; English.
XX
CC   Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted
CC   to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)
CC   gene, which inhibit its expression. The antisense oligonucleotides were
CC   designed to target different regions of the human and/or mouse C/EBP
CC   alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels
CC   by quantitative real-time PCR. The C/EBP family of proteins are a family
CC   of transcription factors which regulate the expression of a wide range of
CC   genes that control normal tissue development, cellular function, cellular
CC   proliferation and functional differentiation. C/EBP beta (also known as
CC   C/EPB2, LAP, TCF5, CRP2, NFIL6, IL6DBP, NF-M, AGP/EBP and Apc/EBP)
CC   primarily regulates hormone responsiveness and oxidative stress responses
CC   and is a mediator of IL-6 (interleukin-6) signalling. C/EBP beta is
CC   thought to be involved in carbohydrate metabolism, immunity, the Th1
CC   response, female fertility and gluconeogenic pathways. C/EBP beta is
CC   expressed in the liver, lung, spleen, kidney, brain, and testis, with the
CC   highest expression found in the lung. It is also expressed at a higher
CC   level in malignant ovarian tissue compared with normal ovarian tissue,
CC   and its expression in pancreas is upregulated in response to chronically
CC   elevated levels of glucose, indicating that it is involved in the
CC   impairment of insulin secretion in type II diabetes. The oligonucleotides
CC   of the invention are useful for diagnosis, prevention and treatment of
CC   conditions associated with C/EBP beta expression, such as cancer
CC   (particularly ovarian cancer), tumour formation, diabetes (particularly
CC   type II diabetes), infection, or inflammation

PT   Novel isolated polypeptides useful for diagnosis of prostate cancer.
XX
PS   Claim 18; Page 146; 152pp; English.
XX
CC   The invention describes novel isolated polypeptides (I, Ib) useful for
CC   diagnosing prostate cancer comprising obtaining a patient sample
CC   containing prostate cells and detecting the presence or absence of an
CC   expression product of a HML-2 endogenous retrovirus in a patient sample.
CC   Polynucleotides associated with (I) are useful for diagnosis or treatment
CC   of testicular cancer, multiple sclerosis or insulin-dependent diabetes
CC   mellitus. An inhibitor of a HML-2 protease and a transdominant negative
CC   mutant of HML-2 cORF are also useful in the manufacture of a medicament
CC   for treating prostate cancer. (I) and (Ib) are useful for generating
CC   antibodies specific to the polypeptides associated with cancer, as
CC   targets for therapeutic intervention, and in immunising a transgenic
CC   animal. This sequence represents a probe used for detecting the presence
CC   of human endogenous retrovirus (herv) of the HML-2 sub-group in prostate
CC   tissue

```

XX
PS Claim 15; SEQ ID NO 558; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Novel antisense compound which is targeted to nucleic acid encoding
PT   ribonuclease L, and inhibits expression of ribonuclease L protein, useful
PT   for treating diseases or conditions resulting from infections and
PT   aberrant apoptosis.
XX
PS   Claim 3; Page 77; 106pp; English.
XX
CC   The present invention describes a compound (I) of 8-50 nucleobases in
CC   length targeted to a nucleic acid molecule (II) encoding ribonuclease L
CC   (III), and which specifically hybridises with (II) and inhibits
CC   expression of (III), where (I) specifically hybridises with at least an 8
CC   -nucleobase portion of an active site on (II). (I) has cytostatic,
```

```
CC   antimicrobial, antiinflammatory and antitumour activities, and can be
CC   used as a ribonuclease L expression inhibitor and in antisense gene
CC   therapy. (I) is useful for inhibiting the expression of ribonuclease L in
CC   cells or tissues, and for treating an animal having a disease condition
CC   associated with ribonuclease L, e.g. infection, aberrant apoptosis or
CC   cancer. (I) is also useful for modulating the process of RNA-mediated
CC   interference (RNAi) in a cell or animal. (I) is also useful
CC   prophylactically, e.g. to prevent or delay infection, inflammation or
CC   tumour formation. (I) is useful as a tool in differential and/or
CC   combinatorial analyses to elucidate expression patterns of a portion or
CC   the entire complement of genes expressed within cells and tissues. (I) is
CC   also useful for research, therapeutics and diagnostics. (I) is also
CC   useful for distinguishing functions of various members of a biological
CC   pathway, and in antisense gene therapy. The present sequence represents a
CC   human ribonuclease L chimeric phosphorothioate antisense oligonucleotide,
CC   which is used in an example from the present invention

PT   Detecting point mutation in DNA strand, by hybridizing target DNA strand
PT   having mutation with test DNA strand to form duplex, contacting the
PT   duplex with RNase H and determining the cleavage of test strand by RNase
PT   H.
XX
PS   Example 5; Fig 4; 26pp; English.
XX
CC   The invention relates to a novel method for detecting a point mutation in
CC   a DNA strand. The novel method comprises hybridising a target DNA strand
CC   containing or suspected of containing a point mutation with a test
CC   nucleic acid strand complementary to the DNA strand to form a target DNA
CC   strand/test nucleic acid strand duplex, contacting the duplex with an
CC   RNase H, and determining whether the ribonucleotide residues within the
CC   nucleotide sequence are cleaved by RNase H. The method is useful for
CC   detecting a point mutation in a DNA strand, where the point mutation to
CC   be detected is a single nucleotide polymorphism, preferably a
CC   polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian
CC   or human genome. The method is useful to detect any nucleic acids from
CC   any species of organisms such as Acintobacter, Bacillus, Candida,
CC   Enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses.
CC   This polynucleotide sequence represents a ribonucleotide relating to the
CC   mutation detecting method of the invention

```

```
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of human farnesoid X receptor (FXR). FXR is
CC   also known as NR1H4, retinoid X receptor-interacting protein 14 (RIP14)
CC   and bile acid receptor (BAR). The antisense oligonucleotide is useful for
CC   inhibiting the expression of human FXR in cells or tissues. It is
CC   particularly useful for treating or preventing a disease or condition
CC   associated with FXR in a human, e.g. cardiovascular disease,
CC   atherosclerosis or hypercholesterolaemia. The antisense compound is
CC   useful for diagnostics, therapeutics, prophylaxis, or as research
CC   reagents or kits. It is also used in gene therapy. The present sequence
CC   is an antisense oligonucleotide targetted to human FXR DNA. This sequence
CC   is used to illustrate the method of the invention

PT   Determining whether an individual is predisposed to susceptibility to low
PT   bone mineral density (BMD) and/or bone damage, involves identifying
PT   polymorphisms in associated genes.
XX
PS   Example 8; Page 237; 246pp; English.
XX
CC   The present invention describes a method of determining whether an
CC   individual is predisposed to susceptibility to low bone mineral density
CC   (BMD) and/or bone damage comprising identifying whether the individual
CC   has at least one polymorphism in a polynucleotide encoding a protein,
CC   where the polynucleotide is one of 81 200-500 nucleotide sequences (S1,
CC   see ADC98235 to ADC98315). An agent identified in an method from the
CC   present invention which can be used for the prevention or treatment of a
CC   disease resulting in susceptibility to low BMD and/or bone damage is
CC   useful in the manufacture of a medicament for use in modulating the
CC   susceptibility to low BMD and/or bone damage. The disease associated with
CC   low BMD and/or bone damage is osteoporosis. The present PCR primer
CC   sequence is used in the exemplification of the present invention.

PT   Predicting potential of oligonucleotides to hybridize to target
PT   nucleotide sequence comprises determining and evaluating for each
PT   oligonucleotide a parameter predictive of the oligonucleotides ability to
PT   hybridize with target.
XX
PS   Example 2; SEQ ID NO 558; 423pp; English.
XX
CC   The invention relates to a method of predicting the potential of
CC   oligonucleotides to hybridise to target nucleotide sequences. The method
CC   is useful for predicting the potential of an oligonucleotide to hybridise
CC   to a target nucleotide sequence, e.g. RNA or DNA or a sequence that
CC   contains chemically modified nucleotides. The method is also useful for
CC   predicting the potential of the oligonucleotides to hybridise to a
CC   complementary target nucleotide sequence. The method is useful to predict
CC   efficient hybridisation oligonucleotides for each of multiple target
CC   sequences therefore very large arrays may be constructed and tested with
CC   minimum synthesis of oligonucleotides. The present sequence represents a
CC   HIV PRT antisense derived probe.

CC   The invention relates to a method of treating an inflammatory skin
CC   disorder in an individual by topically applying an antisense compound
CC   targeted to a nucleic acid molecule encoding a human B7 protein. The
CC   invention is for treating an inflammatory skin disorder in individual.
CC   The skin disorder is psoriasis, contact dermatitis, atopic dermatitis,
CC   seborrheic dermatitis, nummular dermatitis, generalised exfoliative
CC   dermatitis or eczema. The invention effectively modulates critical
CC   costimulatory molecules such as the B7 protein. The present sequence
CC   represents a human B7-1 targeted oligonucleotide.

CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

PT   Novel isolated nucleic acid encoding a promoter which is capable of
```

PT driving chemically inducible but not wound- or pathogen-inducible
PT expression of an associated nucleotide sequence.
XX
PS Example 3; Page 30; 88pp; English.
XX
CC The invention relates to an isolated nucleic acid molecule (a promoter of
CC rice chemically induced cDNA (RCI-1), which encodes a lipoxygenase)
CC capable of driving chemically-inducible but not wound- or pathogen-
CC inducible expression of an associated nucleotide sequence. Also included
CC are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the
CC lipoxygenase gene, promoter fragments, the lipoxygenase transit peptide
CC which directs expressed proteins to the plastid, a vector comprising the
CC promoter or fragments and a transgenic plant comprising the vector. The
CC promoter or fragments are useful for expressing a nucleotide sequence of
CC interest. The transit peptide is useful for targeting an associated
CC protein of interest to plastids. A nucleic acid which expresses
CC polypeptide having lipoxygenase activity is useful for inhibiting fungal
CC mycotoxins when transformed into a plant. The lipoxygenase is useful for
CC inhibiting fungal mycotoxins. The promoter is useful for regulating
CC transcription of a chemically inducible but not wound or pathogen
CC inducible gene, which involves applying a chemical regulator to a plant
CC or seed containing a chemically regulatable nucleotide sequence.
CC Transgenic plants as described above are useful for breeding improved
CC plant lines that for example increase the effectiveness of conventional
CC methods such as herbicide or pesticide treatment or allow to dispense
CC with the methods due to their modified genetic properties. New crops with
CC improved stress tolerance can be obtained that, due to their optimised
CC genetic equipment yield harvested product of better quality than products
CC that were not able to tolerate comparable adverse developmental
CC conditions. The present sequence is an anchored oligo-dt reverse RT-PCR
CC primer (reverse transcriptase PCR) used to isolate the cDNA encoding rice
CC lipoxygenase

PT Assay of genetic sequences based on triplex formation from double
PT stranded analyte - and hybrid of anchor and reporter sequences, with
PT reporter released if triplex formation occurs, used e.g. to identify
PT bacteria.
XX
PS Disclosure; Col 17-18; 168pp; English.
XX
CC The present sequence represents a polynucleotide that is able to form a
CC triple helix with a double stranded sequence. Cytosine bases in the
CC present can be replaced with 5-methylcytosine for increased triplex
CC stability. The present sequence is used in the assay of the invention,
CC where it can be part of the anchor DNA or reporter DNA sequence. The
CC assay comprises adding a sample containing double-stranded DNA test
CC sequences to an aqueous medium containing at least one complex of anchor
CC DNA, attached to a solid support, and reporter DNA, where either a part
CC of the anchor DNA or reporter DNA is designed to form a triple-strand
CC structure with part of the test sequence. Triplex formation results in
CC displacement of the reporter DNA which is detected as an indication of
CC the presence of the DNA test sequence. The method is used to detect DNA
CC sequences, particularly for identification of bacteria (by detecting
CC genes for ribosomal RNA) in clinical samples, but also detection of
CC oncogenes and Hepatitis B virus

PT Novel dysferlin genes and related proteins useful for diagnosis, risk
PT identification and treatment of hereditary muscular dystrophies and other
PT dysferlin related disorders.
XX
PS Claim 8; Page 134; 146pp; English.
XX
CC This invention describes a novel human dysferlin nucleic acid (I) and its
CC encoding protein (II), which has anti-dystrophic activity and can be used
CC for gene therapy. Introduction of (I), a vector comprising (I) or
CC dysferlin into a cell of a mammal can be used to decrease the symptoms of
CC muscular dystrophy. The dysferlin gene is normally expressed in skeletal
CC muscle cells and is selectively mutated in several families with the
CC hereditary muscular dystrophies, e.g. Miyoshi myopathy and limb girdle
CC muscular dystrophy-2B. The primers and oligonucleotides derived from (I)
CC can be used in diagnosis of or risk identification for dysferlin-related
CC disorders in patients, fetus, or pre-embryos. Expression of brain-
CC specific dysferlin may be important as a marker for normal neural
CC development. Dysferlin DNA or subgenomic coding sequences can be used for
CC therapy of the hereditary muscular dystrophies. AAX82919-X82945 represent

CC 4684, 5015-5034, 5610-5629, 5726-5735, 6035-6054, 6179-6198, 6243-6263
CC and 6529-6548 of the human dysferlin nucleotide sequence given in
CC AAA36744. Dysferlin nucleotide sequences containing specific mutations
CC can be used for diagnosing a patient, a foetus or a pre-embryo at risk of
CC developing a dysferlin associated disorder by detecting mutations in the
CC dysferlin gene in biological samples from patients. Alternatively, the
CC biological sample containing genomic DNA can be incubated with a
CC restriction enzyme, preferably BanII, Bsp1286I, RsaI, HhaI, HaeIII,
CC Bsp1286, NlaIV, NlaIII, BcgI, AvaII, BstEII, PleI, HaeI, AluI, ApoI,
CC Tsp509I, SalI, HincII, TaqI, HinfI, TfiI, SfaNI or FokI and the presence
CC or absence of a restriction enzyme site in the sample is detected as an
CC indication of the presence or absence of a particular mutation in the
CC sample. Dysferlin polynucleotides are useful for treating hereditary
CC muscular dystrophies such as miyoshi myopathy (MM) and limb girdle
CC muscular dystrophy-2B (LGMB-2B). MM and LGMB-2B map to the human
CC chromosome 2p12-14 region between the genetic markers D2S292 and D2S286.
CC The present sequence represents a primer for human dysferlin

PT   New nucleic acids encoding anti-IgE antibodies such as Hu-901 or their
PT   fragments, useful in the gene therapy of allergic diseases.
XX
PS   Example 1; Page 10; 52pp; English.
XX
CC   The present sequence is the 5'PCR primer L1-5 used for the preparation of
CC   DNA construct for scFv (single chain variable fragment) expression of
CC   anti-IgE without signal peptide. This primer was used to obtain a 330-bp
CC   DNA fragment of the Hu-901 light chain variable region cells by using the
CC   pHCMV-VL1-huCkappa plasmid DNA as the template. Humanised anti-IgE genes
CC   are incorporated in the genome of a recombinant adenovirus vector as an
CC   independent transcriptional unit, and packaged into infectious virus
CC   particles. Upon infection of host, the recombinant adenovirus vector will
CC   direct the production of either intact anti-IgE antibody or an scFv
CC   fragment in the serum, which will bind free circulating IgE, resulting in
CC   the reduction of free serum IgE. The binding of the antibody or fragment
CC   to IgE-bearing B cells may lower IgE levels by down-regulating IgE
CC   production by these B cells. These methods are useful in the gene therapy
CC   of allergic diseases

PS   Example; Col 41-42; 131pp; English.
XX
CC   The invention relates to the ASTH1 locus on the short arm of human
CC   chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes, which
CC   are associated with a genetic predisposition to asthma and bronchial
CC   hyperreactivity. The ASTH1I and ASTH1J genes are oriented in opposite
CC   directions with the ASTH1 locus, and have similar patterns of expression
CC   and common sequence motifs. They are both expressed in trachea, lung and
CC   several other tissues. ASTH1I and ASTH1J are novel members of the ets
CC   family of transcription factors, which have been implicated in the
CC   activation of a variety of genes including the TCRa gene and cytokine
CC   genes known to be important in the aetiology of asthma. Both ASTH1I and
CC   ASTH1J mRNAs are alternatively spliced. Alternative splicing of
CC   transcripts has no effect on the open reading frame of ASTH1J, as the
CC   exons involved are all 5' to the start codon in exon b. In contrast,
CC   alternative splicing of ASTH1I transcripts results in 3 different ASTH1I
CC   isoforms. The invention also encompasses mouse asth1j protein. The ASTH1
```

CC nucleic acids are useful as diagnostics to identify a hereditary
CC predisposition to asthma, as probes for identifying ASTH1 related genes,
CC for identifying expression of the gene in a biological specimen, and for
CC generating genetically modified non-human animals or site specific gene
CC modifications in cell lines. The encoded ASTH1 proteins are useful as
CC immunogens to raise specific antibodies; in drug screening for
CC compositions that mimic or modulate activity or expression of ASTH1I
CC and/or ASTH1J (including altered forms of these proteins); and as a
CC therapeutic. The ASTH1 genes or fragments thereof, encoded proteins,
CC ASTH1 genomic regulatory regions, and anti-ASTH1I and anti-ASTH1J
CC antibodies are useful in the identification of individuals predisposed to
CC development of asthma, and for modulation of gene activity in vivo for
CC prophylactic and therapeutic purposes. The intact ASTH1I or ASTH1J
CC proteins or active fragments thereof may be used to modulate or reduce
CC bronchial hyperreactivity. Sequences AAA80260-A80261 and AAA80264-A80416
CC represent polymorphic sites within the ASTH1J or ASTH1I genes

PT Selectively incorporating or encapsulating proteinaceous target molecules
PT into virus like particles, useful for preparation of a medicament for
PT treating/preventing disease, comprises co-expressing target and signal
PT molecules in cells.
XX
PS Disclosure; Page 73; 125pp; English.
XX
CC This invention relates to selectively incorporating or encapsulating
CC proteinaceous target molecules into virus like particles (VLPs)
CC comprising co-expressing target and signal molecules in a cell. The
CC method of encapsulating target molecules can be used in the production of
CC virus like particles which can be used for preparing a medicament for
CC treating or preventing a genetic disease, tumours, autoimmune or
CC infectious diseases. The VLPs can also be used for identifying and
CC characterising the interactions between target molecules, also for
CC identifying potential pharmaceutically active substances and for the
CC identification of analytes in diagnostic applications. The present
CC sequence represents DNA encoding an E-coil used in the production of
CC coiled coil tagged target and signal molecules for use in the
CC construction of the virus like particles of the invention

PT New nucleic acid containing polymorphisms in the cyclooxygenase-2 gene,
PT for gene therapy of inflammation and for establishing a genotype or
PT haplotype.
XX
PS Example 1b; Page 40; 118pp; English.
XX
CC This invention relates to a polynucleotide sequence that is a polymorphic
CC variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene
CC also referred to as cyclooxygenase 2. The human PTGS2 gene sequence
CC AAF80896 contains 27 single nucleotide polymorphisms (SNPs). AAF80896 and
CC AAF80897 represent human PTGS2 gene and coding sequence, and the PTGS2
CC protein is represented by AAB72199. The invention includes PCR and
CC sequencing primers, and probes represented in AAF80898 - AAF81151 which
CC are used to isolated and characterise the PTGS2 gene sequence, and to
CC locate the positions of the SNPs. PTGS2 proteins and polynucleotide
CC sequences are used to express variant PTGS2 proteins, for structural
CC analysis or drug-binding studies and also in gene therapy (either
CC expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are
CC useful for diagnosis, prognosis and therapy and analysis of the new, and
CC known, polymorphisms and used to determine PTGS2 haplotype and genotype,
CC especially for determining association between a particular trait, e.g. a
CC clinical response to drugs that target PTGS2 but also disease
CC susceptibility, severity or stage. Anti-PTGS2 antibodies are particularly
CC used for developing diagnostic tests and treatments for immune-related
CC disorders such as arthritis and inflammation. The polymorphisms may also
CC be used to study expression and biological function of PTGS2. Transgenic
CC animals that express PTGS2 are used to study expression of PTGS2
CC isogenes, for in vivo drug screening and testing, and for assessing
CC effects of therapeutic agents

PT Novel viral vector useful in preparation of medicament to cause neurite
PT development or for treatment of neurological disorder, comprises a
PT sequence encoding a receptor, preferably retinoic acid receptor beta-2.
XX
PS Example 7; Page 114; 241pp; English.
XX
CC The present invention relates to viral vectors comprising a nucleic acid
CC sequence encoding retinoic acid receptor beta-2 (RARbeta2). The vector is
CC preferably based on or derived from a lentivirus, more preferably non-
CC primate such as equine infectious anaemia virus (EIAV), and comprises
CC deleted regions of the gag-pol genes. The vector may be engineered to
CC replace all or part of the env gene with env sequences from other RNA
CC viruses (e.g. gene encoding vesicular stomatitis virus G, VSV-G protein),
CC by a method of pseudotyping, to broaden the infectious spectrum of the
CC viral vector. The viral vectors of the invention are useful in the
CC preparation of a medicament, or in gene therapy to stimulate neurite
CC development, or for the treatment of a neurological disorder (e.g.
CC Parkinson's disease and spinal cord injuries). The vectors are also
CC useful for treating cancers, inflammatory disorders, dermatological
CC disorders, autoimmune disorders, cardiovascular disorders, ulcers,
CC haemophilia, liver cirrhosis, bone marrow transplantation or other
CC transplantation complications. The vectors eliminate the need for
CC administration of nerve growth factor (NGF) to a subject, enable neurite
CC outgrowth to be promoted in adult neural tissue, and enable RARbeta2 to
CC be introduced into non-dividing mammalian cells such as neuronal cells.
CC The present sequence represents a primer used in the methods of the
CC present invention

PT Arraying genome clones.
XX
PS Claim 4; Page 43; 528pp; Japanese.
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC represent PCR primers for human chromosome 21q22.1, which are

PT   Isolated nucleic acid molecules having polymorphisms in known human genes
PT   e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT   for locating, identifying and characterizing the genes responsible for
PT   disorder-related traits.
XX
PS   Example 3; Page 103; 714pp; English.
XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a
CC   polymorphic DNA sequence of the invention

CC   like particle, or physically associating a two component proteinaceous
CC   target molecule complex with a virus like particle comprising co-
CC   expressing target molecules in recombinant cells together with signal
CC   molecules. The method is useful for achieving enrichment of substances
CC   (e.g. proteins, polynucleotides, oligonucleotides, organic molecules of
CC   lower molecular weight or ion) in a medium in which cells are arranged
CC   when the virus-like particles are released in the medium, where the virus
CC   -like particles incorporate, encapsulate or are associated with the
```

```
CC   substances. The virus-like particles are useful for concentrating,
CC   isolating or purifying recombinant molecules. They are particularly
CC   useful in pharmaceutical screening and functional genomics, e.g. for
CC   detecting compounds influencing viral maturation, identifying modulators
CC   of cell surface protein-mediated activity or identifying modulators of
CC   receptor- or ion channel-mediated activity. The present sequence
CC   represents a coil DNA sequence used in the methods of the present
CC   invention

PT   New isolated DNA sequence and polypeptide, useful for diagnosing a
PT   patient as having an increased risk of developing hereditary
PT   hemochromatosis disease or anemia, or screening potential therapeutic
PT   agents for treating the disease.
XX
PS   Disclosure; Page 28; 66pp; English.
XX
CC   The present invention provides the protein and coding sequences of the
CC   ferroportin 1 (SLC11A3) gene, and describes the A734C base change present
CC   in the gene which causes hereditary haemochromatosis (HH). This affects
CC   SLC11A3 mediated iron transport. The sequences can be used in the
CC   diagnosis and treatment of hereditary haemochromatosis and anaemia. The
CC   present sequence is a PCR primer used to isolate the sequences in the
CC   exemplification of the invention

XX
PS   Claim 71; SEQ ID NO 246; 176pp; English.
XX
CC   The present invention describes an RNA (I) used for the interference or
CC   inhibition of expression of a target gene, where (I) comprises double
CC   stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang
CC   having a length of 0-nucleotide to 5-nucleotides on each strand, where
CC   the sequence of the double stranded RNA is substantially identical to a
CC   portion of a mRNA or transcript of the target gene. Also described: (1)
CC   interfering with or inhibiting the expression of a target gene in a cell
CC   by exposing the cell to an amount of (I); (2) a gene silencing array
CC   comprising a substantially flat substrate, and addressably arrayed
CC   different double-stranded RNAs; (3) an array-based method of assessing a
CC   phenotypic effect of a double-stranded RNA on a target gene; (4)
CC   validating a gene as a potential drug target for a disease or condition;
CC   (5) selecting an optimised sequence of a double-stranded RNA for
CC   interference with or inhibition of expression of a target gene in a cell;
CC   and (6) a short double-stranded RNA effective for interfering with or
CC   inhibiting expression of a target gene comprising any of 311 20-78
CC   nucleotide sequences (see ADC16276 to ADC16586). (I) has cytostatic
CC   activity, and can be used in gene therapy. The RNAs are useful as reverse
CC   genetic and/or therapeutic tools for interfering or inhibiting expression
CC   of a target gene. They are useful for treating proliferative diseases,
CC   e.g. cancer.

PT New nucleic acid encoding specific protein tyrosine phosphatases - useful
PT for identifying specific modulators for treatment and prevention of
PT cancer and neurodegenerative disease.
XX
PS Example 23; Page 132; 193pp; English.
XX
CC The present invention describes isolated, enriched or purified nucleic
CC acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The
CC above proteins, other than ALK-7, are protein tyrosine phosphatases
CC (PTPs) and are used to identify substances that modulate their activity
CC (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These
CC substances are used to treat or prevent diseases associated with abnormal
CC signal transduction pathways that involve the proteins, particularly
CC cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is
CC a type I receptor serine/threonine kinase) are used to promote neuronal
CC survival, particularly for treating Alzheimer's, Parkinson's or
CC Huntington's diseases. Nucleic acid fragments of the polynucleotides
CC encoding the proteins can be used as probes to identify and clone related
CC sequences; to detect protein-encoded RNA; to generate transgenic animals
CC and in gene therapy (optionally after mutation). Ab are used to determine
CC the proteins. The present sequence represents a PCR primer for rat ALK-7

PT Detecting single nucleotide polymorphism by utilizing a bioelectronic
PT microchip having several test sites.
XX
PS Example 1; Page 11; 46pp; English.
XX
CC Reporter probes AAC61609-20 were used to discriminate against different
CC alleles of the human mannose binding protein (MBP) gene. MBP is a
CC component of the innate immune system and is capable of opsonizing
CC pathogenic microorganisms. Inheritance of variant forms of MBP gives rise
CC to a subtle immunologic defect that can be enhanced during a period of
CC immunosuppression. Four distinct alleles of the MBP gene have been
CC identified. The method of the invention is used for detecting single
CC nucleotide polymorphisms (SNPs) in MBP. The method utilises electronic
CC circuitry on silicon microchips. The method provides accurate
CC discrimination of amplified DNA samples following electronic transport,
CC concentration, and attachment of DNA to selected electrodes (test sites).
CC The test sites make up organised arrays of samples that are distinguished
CC by using internal controls of dual labelled reporters comprising wild
CC type and mismatched sequences to validate the SNP genotype. Multiples of
CC SNPs in target nucleic acids from a patient sample source or a SNP in
CC target nucleic acids of multiple patient sample sources can also be
CC detected using the electronically addressable microchip

PT New nucleic acid encoding abscisic acid responsive element binding factor
PT 4, useful for generating transgenic plants, which are tolerant to
PT multiple environmental stresses.
XX
PS Disclosure; Col 5; 42pp; English.
XX
CC The invention relates to nucleic acid encoding the Abscisic acid
CC responsive element (ABRE)-binding factor 4 (ABF4). ABF4 belongs to the
CC ABF family of factors which bind abscisic acid responsive elements in
CC plants. Expression of ABFs is inducible by abscisic acid and various
CC stress treatments. ABFs have the potential to activate a large number of
CC abscisic acid/stress responsive genes and thus a nucleic acid molecule
CC encoding ABF4 is useful for generating transgenic plants that are
CC tolerant to multiple environmental stresses. The present sequence is a 5'
CC PCR primer which is used to isolate full length Arabidopsis thaliana ABF4
CC from clone 19

PT   sequences associated with the channel.
XX
PS   Claim 21; Page 34; 125pp; English.
XX
CC   The present sequence for 5'-bisulfite PCR primer is used to study the
CC   methylation state of human fibrillin-1 (FBN1) which maps to chromosome
CC   15q21.1. The methylation state of specific regions within CpG islands
CC   associated with a novel T-type calcium channel CACNA1G gene correlate
CC   with several cancerous phenotypes involving various tissue and cell
CC   types. Since aberrant methylation of normally unmethylated CpG islands is
CC   often observed in immortalised and transformed cells, CACNA1G is
CC   implicated in cellular proliferative disorders e.g. leukaemia,
CC   colorectal, lung, breast and other cancers. The nucleic acid coding for
CC   CACNA1G is useful as a marker for screening cancer and age related
CC   diseases. A diagnostic kit containing primers (AAS01574-AAS01623) for
CC   amplification of a CpG-containing nucleic acid, where the primer
CC   hybridises with a target polynucleotide sequence (AAS01627-AAS01676), can
CC   be used for detecting aberrant methylation. The CpG island sequences
CC   (AAS01677-AAS01692) are selected from genes encoding CACNA1G,
CC   apolipoprotein B (APOB), caudal type homeobox transcription factor 2
CC   (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1 (FBN1), G
CC   protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B';
CC   HSPA6), RasGAP-related protein (IQGAP2), klotho (KL), proteinase-
CC   activated receptor 2 (PAR2), paired-like homeodomain transcription factor

PT   New nucleic acid molecule for use as a marker for screening cancer,
PT   comprises the coding region for a T-type calcium channel and regulatory
PT   sequences associated with the channel.
XX
PS   Claim 20; Page 37; 125pp; English.
XX
CC   The present sequence for human fibrillin-1 (FBN1) 5'-target sequence
CC   (complementary to the 5'-bisulfite PCR primer) is used to study the
CC   methylation state of FBN1 which maps to chromosome 15q21.1. The
CC   methylation state of specific regions within CpG islands associated with
CC   a novel T-type calcium channel CACNA1G gene correlate with several
CC   cancerous phenotypes involving various tissue and cell types. Since
CC   aberrant methylation of normally unmethylated CpG islands is often
CC   observed in immortalised and transformed cells, CACNA1G is implicated in
CC   cellular proliferative disorders e.g. leukaemia, colorectal, lung, breast
CC   and other cancers. The nucleic acid coding for CACNA1G is useful as a
CC   marker for screening cancer and age related diseases. A diagnostic kit
CC   containing primers (AAS01574-AAS01623) for amplification of a CpG-
CC   containing nucleic acid, where the primer hybridises with a target
CC   polynucleotide sequence (AAS01627-AAS01676), can be used for detecting
```

```
CC   aberrant methylation. The CpG island sequences (AAS01677-AAS01692) are
CC   selected from genes encoding CACNA1G, apolipoprotein B (APOB), caudal
CC   type homeobox transcription factor 2 (CDX2), epidermal growth factor
CC   receptor (EGFR), FBN1, G protein-coupled receptor 37 (GPR37), heat shock
CC   70kD protein 6 (HSP70B'; HSPA6), RasGAP-related protein (IQGAP2), klotho
CC   (KL), proteinase-activated receptor 2 (PAR2), paired-like homeodomain
CC   transcription factor 2 (PITX2), patched A and B (PTCHA; PTCHB) and
CC   syndecan 1 and 4 (SDC1; SDC4) or a MINT31 sequence

PT   Nucleic acid encoding novel transcription factors that bind to various
PT   abscisic acid responsive elements, for generating stress tolerant
PT   transgenic plants.
XX
PS   Disclosure; Page 5; 37pp; English.
XX
CC   The sequence represents a PCR primer used to isolate DNA encoding an
CC   abscisic acid responsive element binding factor (ABF) protein. ABFs are
CC   bZIP class transcription factors that can bind to two classes of abscisic
CC   acid responsive elements (ABRE), namely G-box-like ABREs (G/ABRE) and
CC   coupling element-like ABREs (C/ABRE). Expression of ABF is inducible by
CC   abscisic acid and various stress treatments and they can transactivate an
CC   ABRE-containing reporter gene in yeast. Therefore, the ABFs are useful
CC   for activating a large number of abscisic acid or stress responsive genes
CC   and for generating transgenic plants that are tolerant to multiple
CC   environmental stresses

PT New nucleic acid molecule encoding Abscisic acid responsive element
PT binding factor 1 (ABF1) which can be used to generate transgenic plants
PT that are tolerant to multiple environmental stresses.
XX
PS Disclosure; Col 6; 42pp; English.
XX
CC The sequence represents 5' PCR primer #2 used to isolate full length
CC abscisic acid responsive element binding factors, ABF3 and ABF4, from an
CC Arabidopsis cDNA library. Abscisic acid (ABA) is a major plant hormone
CC involved in response to adverse environmental conditions such as drought,
CC high salt and cold/freezing. This response involves induced expression of
CC various genes. ABA-responsive elements (ABREs) are cis-regulatory
CC elements that mediate the ABA-modulated gene and interact with a novel
CC class of ABRE-binding factors (ABFs). ABFs are basic leucine zipper
CC (bZIP) class transcription factors that bind to both G/ABREs and C/ABREs.
CC ABFs have the potential to activate a large number of ABA/stress
CC responsive genes and can be used to generate transgenic plants that are
CC tolerant to multiple environmental stresses

PT Arraying genome clones.
XX
PS Claim 4; Page 31; 528pp; Japanese.
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC represent PCR primers for human chromosome 21q22.1, which are
CC specifically claimed for use in the present invention

PT Diagnosing the presence of, or susceptibility to, retinal dystrophy,
PT cardiomyopathy, endocrinopathy, diabetes, or Alstrom syndrome in an
PT individual, comprises detection or modulation of the ALMS1 protein or
PT gene region.
XX
PS Disclosure; Page 39; 121pp; English.
XX
CC The present invention describes a method of diagnosing the presence of,
CC or susceptibility to, retinal dystrophy, cardiomyopathy, endocrinopathy,
CC diabetes, or Alstrom syndrome in an individual. The method comprises
CC typing in a sample from the individual the ALMS1 protein or ALMS1 gene
CC region of the individual, or detecting aberrant ALMS1 activity. Human
CC ALMS1 is located to chromosome 2, more specifically to 2p13. ALMS1 has
CC ophthalmological, cardiant, antidiabetic, hepatotropic and nephrotropic
CC activities, and can be used in gene therapy. The method is useful for

```
CC   diagnosing the presence of, or susceptibility to, retinal dystrophy,
CC   cardiomyopathy, endocrinopathy (e.g. liver disease or renal impairment),
CC   diabetes, or Alstrom syndrome in an individual. ALMS1 sequences can be
CC   used in an agent that prevents or treats retinal dystrophy,
CC   cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a
CC   medicament for treating a patient who has been diagnosed as having or
CC   being susceptible to retinal dystrophy, cardiomyopathy, endocrinopathy or
CC   diabetes. ACF42632 to ACF42747 and ABR82113 to ABR82118 represent
CC   sequences used in the exemplification of the present invention

PT   New expression cassettes or genes isolated from Streptomyces cinnamoneus,
PT   useful for producing a library of lantibiotic-producing host cells or
PT   lantibiotics, which are useful as food additives and antibacterial
PT   agents.
XX
PS   Example 3; Page 60; 111pp; English.
XX
CC   The invention relates to expression cassettes or sets of nucleic acids
CC   comprising various open reading frames selected from (a) a cinA open
CC   reading frame (orf), a cinM orf, and optionally a cinX orf; or (b) a cinA
CC   orf, a cinM orf, a cinT orf, a cinH orf, a cinY orf, and optionally a
CC   cinX orf. The expression cassettes, set of nucleic acids, (set of)
CC   vectors, or methods are useful for producing a library of lantibiotic-
CC   producing host cells or a library of lantibiotics. These are particularly
CC   useful for producing lantibiotic cinnamycin or its modified versions. The
CC   lantibiotics are useful as antibiotics having efficacy and utility as
CC   food additives and antibacterial agents against Propionibacterium acnes
CC   and problematic pathogens, e.g. methicillin-resistant Staphylococcus
CC   aureus (which has or is developing resistance to many commonly used
CC   antibiotics), or Streptococcus pneumoniae. Sequences ABZ58796-799
CC   represent PCR primers used in the construction of a cinA deletion

XX
PT New polypeptides, designated as NOVX, useful for diagnosing and treating
PT infections, neurological diseases, cancer, allergy, and bone,
PT immunological, skin, renal, brain, muscle and autoimmune disorders.
XX
PS Example 3; Page 659; 672pp; English.
XX
CC The invention relates to a novel isolated polypeptide, designated NOVX
CC (NOV1 - 33), consisting of a mature form of one of 61 sequences, given in
CC the specification, or its variant, where amino acid residue(s) in the
CC variant differ from the mature form, provided that the variant differs in
CC not more than 15 % of the amino acids from the sequence of the mature
CC form. The NOVX polypeptides, nucleic acids encoding the polypeptides, and
CC an antibody to the polypeptides, are useful for treating or preventing a
CC NOVX-associated disorder in humans and for treating a syndrome associated
CC with a human disease (NOVX-associated disorder). NOVX polypeptides and
CC the encoding nucleic acids, are useful for determining the presence of or
CC predisposition to a disease associated with altered levels of NOVX
CC polypeptide and polynucleotide, by measuring the level of polypeptide
CC expression or the amount of nucleic acid from a mammal and comparing it
CC with another mammal not having or not predisposed to the disease. NOVX
CC polypeptide is also useful for identifying an agent that binds to NOVX
CC and a cell expressing NOVX is useful for identifying an agent that
CC modulates the expression or activity of NOVX. The antibodies and a
CC polypeptide having 95 % sequence identity to NOVX polypeptide are useful
CC for treating a pathological state in a mammal. The antibodies are also
CC useful for determining the presence or amount of NOVX in a sample. NOVX
CC polypeptides, polynucleotides and antibodies specific for the
CC polypeptides are useful for treating or preventing disorders or syndromes
CC including trauma, viral, bacterial, fungal, protozoal, and parasitic
CC infections. They can also treat disorders such as e.g., Alzheimer's
CC disease or a stroke. The NOVX encoding nucleic acids are useful for
CC expressing the NOVX proteins, to detect NOVX mRNA, or a genetic lesion in
CC a NOVX gene and to modulate NOVX activity. NOVX sequences are also useful
CC for identifying a cell or tissue type in a biological sample, to amplify
CC DNA sequences from very small biological samples such as tissues e.g.
CC hair or skin or body fluids in forensic biology and as primers and probes
CC for use in identifying and/or cloning NOVX homologues in other cell
CC types. The NOVX proteins are useful as an immunogen to generate
CC antibodies which are useful for diagnostically monitoring protein levels
CC and modulating NOVX activity. Cells comprising NOVX nucleic acids are
CC useful for producing non-human transgenic animals which are useful for
CC studying the function and/or activity of NOVX protein and for identifying
CC and/or evaluating modulators of NOVX protein activity. The NOVX nucleic
CC acids can be used in gene therapy. This polynucleotide sequence
CC represents a NOVX PCR primer of the invention

PT Detection of adjacent and non:adjacent locus, e.g. HLA alleles - by
PT amplifying genomic DNA, for direct determination of haplotype.
XX
PS Claim 29; Page 49; 53pp; English.
XX
CC The primer is specific for nt 1582-1604 of HLA Class I B17 locus. It is
CC used in a method for the prodn. of RFLP fragments for an HLA locus,
CC together with a second primer making up a locus-specific primer (LSP)
CC pair. It is pref. used with a Class I-specific primer which hybridises
CC with at least two different Class I loci, pref. at least one of each of
CC A, B, and C, and most pref. all of these. The Class I primer esp.
CC hybridises with intervening sequence (IVS) III or IVS I sequences. Direct
CC determination of the haplotye is possible, providing useful information
CC for identity of individuals for e.g. paternity case and forensic
CC investigations. See also AAQ10621-Q10669. (Updated on 25-MAR-2003 to

PT   New primers and probes from the factor V gene, useful for detecting the
PT   mutation that causes activated protein C resistance.
XX
PS   Claim 3; Page 11; 14pp; German.
XX
CC   This invention describes novel primers (I) derived from the factor V
CC   gene. (I) are used for detecting APC (activated protein C) resistance,
CC   i.e. a condition, associated with increased incidence of venous (and
CC   possibly arterial) thrombosis, and caused by a mutation in the factor V
CC   gene (G to A change at position 1691, resulting in replacement of Gln by
CC   Arg). The new method does not require restriction enzyme digestion of the
CC   amplicons nor electrophoretic separation (rather the results are read out
CC   automatically by direct measurements of the amounts of amplicons in
CC   chemiluminescent or colorimetric tests). The sensitivity of the assay is
CC   increased 10-100 times by using RNA detection probe and nucleic acid
CC   antibody, so that only small amounts of test material are required and
CC   more than 100 samples may be processed in 20 min. The primers contain 2-
CC   5, preferably 2, additional mismatches at the 3'-end to improve
CC   differentiation between wild-type and mutant sequences. AAA39502-A39508
CC   represent primers used in the method of the invention

PT   New human androgen-induced tumor suppressor cDNA sequence termed
PT   'Androgen Shutoff Gene 3' (AS3), useful as a marker for the efficient
PT   diagnosis and treatment of prostate cancer.
XX
PS   Disclosure; Fig 5; 152pp; English.
XX
CC   This invention relates to a human androgen-induced tumour suppressor cDNA
CC   sequence termed "Androgen Shutoff Gene 3" (AS3). The AS3 gene is located
CC   on chromosome 13 at position 13q12-13q. AS3 has a role in inhibiting cell
CC   proliferation and use as a marker for the efficient diagnosis and
CC   treatment of prostate cancer. The invention includes AS3 cDNA and protein
```

CC sequences, a vector comprising the cDNA sequence, a host cell transfected
CC with the expression vector, and a method for producing an AS3 polypeptide
CC comprising culturing the transfected cells. AS3 has cytostatic activity,
CC and acts to suppress cell proliferation. The AS3 gene is useful as a
CC marker for the efficient diagnosis and treatment of prostate cancer. The
CC AS3 nucleic acid molecule can be used as a source of antisense agents for
CC sequence specific modulation of gene expression. The AS3 protein may be
CC used in the treatment of disorders caused by aberrant modification or
CC mutation of a gene encoding an AS3 protein, misregulation of the AS3 gene
CC or aberrant post-translational modification of the AS3 protein. This
CC sequence represents the boundary between a human AS3 intron and exon

PT Determining a predisposition to epilepsy and/or development of epilepsy
PT comprises determining the genotype of SCN1A, SCN2A and/or SCN3A, or a DNA
PT variant, equivalent, or mutation which shows a linkage disequilibrium.
XX
PS Example 4; Fig 4; 268pp; English.
XX
CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The method
CC comprises determining the genotype of at least one gene selected from
CC SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation which
CC shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all sodium
CC channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome 2q23-
CC q31. Compounds identified as modulators of the biological activity of
CC SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating epilepsy
CC or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to AAB99679
CC represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR primers,
CC oligonucleotides and proteins given in the exemplification of the present
CC invention

PT Polynucleotides comprising single nucleotide polymorphisms in the human
PT dopamine receptor D2, useful for detecting mutations associated with,
PT e.g. schizophrenia, Parkinson's and myoclonus dystonia.
XX
PS Example 1B; Page 39; 135pp; English.
XX
CC The present invention describes polynucleotides comprising single
CC nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2).
CC The polynucleotides may be used in assays to detect and characterise
CC polymorphisms in DRD2 that affect its expression and activity and are
CC involved in disorders such as schizophrenia, Parkinson's and myoclonus
CC dystonia (MD). This information would be useful for studying the
CC biological function of DRD2 as well as in identifying drugs targeting
CC this protein for the treatment of disorders related to its abnormal
CC expression or function. Polymorphisms in the DRD2 gene affect the
CC expression of active and functional polypeptides. Therefore it is
CC advantageous to detect polymorphisms in the DRD2 gene and how those
CC polymorphisms are combined in different copies of the gene. AAF70261 to
CC AAF70308 represent human DRD2 allele specific oligonucleotide probes, and
CC AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide
CC primers which are used in the detection of DRD2 polymorphisms. AAF70405
CC to AAF70452 represent oligonucleotide primers for the detection of human
CC DRD2 polymorphisms which are given in the exemplification of the present
CC invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2
CC gene which are used in examples from the present invention

PT New nucleic acid molecule encoding chimeric proteins with binding
PT specificity for a site on HIV envelope glycoprotein gp120 and a site on
PT gp120 protein or on the extracellular portion of human CD4, for
PT preventing or treating HIV infection.
XX
PS Example 4; Page 29; 48pp; English.
XX
CC The invention discloses a nucleic acid molecule encoding a functional
CC chimeric protein with binding specificity for at least two different
CC sites. At least one site is on the human immunodeficiency virus-1 (HIV-1)
CC envelope glycoprotein (env), gp120, and the other site is either on the
CC gp120 protein or on the extracellular portion of human CD4, the major
CC cellular receptor for HIV. The chimeric protein essentially comprises a
CC first binding region of a soluble extracellular portion of human CD4,
CC consisting of the immunoglobulin (Ig) variable region-like membrane
CC distal domains (V1 and V2) and a second binding region of a variable
CC region of an antibody heavy chain (VH), encoded by the VH3 gene, which is
CC capable of being attached to an adjacent and non-overlapping site on the
CC gp120 protein, or to a site on the extracellular portion of human CD4,
CC and is capable of increasing the capacity of the extracellular portion of
CC human CD4 to interact with gp120 and to block the interaction of HIV with
CC membranal CD4. These two binding regions are physically connected by a
CC linker region. The chimeric protein of the invention is useful for gene
CC therapy and for preventing and treating an HIV infection and for
CC neutralising and inhibiting virus replication and infectivity in a
CC subject, preferably a mammal. The sequence presented is the PCR primer,
CC 22164, which was used to amplify the human VH3 gene, used in the
CC construction of the VH3-CD4 (V1 and V2) chimeric protein

PT Screening human subject for susceptibility or predisposition to viral
PT infection or developing immunodeficiency disease, by detecting
PT polymorphic variants or mutations in gene encoding CD45.
XX
PS Example 1; Page 18; 39pp; English.
XX
CC The invention relates to a method for screening a human subject for
CC susceptibility to viral infection, developing immunodeficiency disease
CC (IDD) and/or a predisposition to developing severe disease following
CC viral infection, or more severe forms of IDD. The method comprises
CC detecting polymorphic variants or mutations in the gene encoding CD45, or
CC evaluating an abnormal pattern of CD45 mRNA/protein expression associated
CC with the presence of the C77G mutant allele of the CD45 gene.
CC Specifically, the viral infection referred to is human immunodeficiency
CC virus (HIV), especially HIV-1, Epstein-Barr virus (EBV) or poliovirus.
CC The method of the invention is useful for screening a subject for
CC susceptibility to haemophagocytic lymphohistiocytosis. The method is also
CC useful for identifying human subjects exhibiting functional abnormalities
CC in peripheral blood mononuclear cells. Subjects having at least one
CC mutant allele are scored as having a higher frequency of peripheral blood
CC mononuclear cells able to produce interferon gamma (IFN-gamma). The
CC method of the invention is simple, non-invasive, reliable, reproducible
CC and amenable to automation. The current sequence represents aPCR primer
CC utilised in an example from the invention for the detection of the C77G
CC mutation in the CD45 gene

PT   Diagnosing or determining cancer or increased risk of cancer in a
PT   patient, by testing Fanconi Anemia/BRCA pathway gene or protein for a
PT   cancer-associated defect, that indicates cancer or increased risk of
PT   cancer.
XX
PS   Example 14; Page 101; 160pp; English.
XX
CC   The invention relates to a novel method of diagnosing or determining if a
CC   patient has cancer or is at increased risk of cancer, involving testing a
CC   Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a
CC   cancer-associated defect, where the presence of one or more cancer-
CC   associated defects is indicative of cancer or an increased risk of cancer
CC   in the patient. The method of the invention has cytostatic activity. The
CC   method is useful for determining if a patient has cancer, or is at
CC   increased risk of developing cancer, e.g. breast, ovarian or prostate
CC   cancer. A microarray of the invention is useful for determining if a
CC   patient has cancer, or is at increased risk of developing cancer, by
CC   hybridising a nucleic acid sample to the nucleic acid sequences from the
CC   array, and detecting the presence of mutations in FA/BRCA pathway genes
CC   in the nucleic acid sample from the patient, where detecting the presence
CC   of mutations is indicative of a patient who has cancer, or is at
CC   increased risk of developing cancer. A method of the invention is useful
CC   for screening a chemosensitising agent, and the agent obtained is useful
CC   for treating a patient having a cancer. The present sequence is used in
CC   the exemplification of the invention.

PT   New conjugate for delivery to the cell nucleus, useful for treating
PT   infection by human immune deficiency virus, comprises targeting peptides
PT   and peptide nucleic acid.
XX
PS   Disclosure; Page 8; 30pp; German.
XX
CC   This invention describes a novel conjugate for mediating specific
CC   transport to the cell nucleus of a peptide nucleic acid (PNA) that
CC   hybridizes to an HIV (human immune deficiency virus) gene, or part of it.
CC   The conjugate comprises a transport mediator for the cell membrane, an
CC   addressing protein or peptide for nuclear importation and the PNA being
CC   delivered. The transport mediator is a peptide or protein able to pass
CC   through the plasma membrane, particularly derived from the penetratin
CC   family protein. The PNA is designed to hybridize to at least part of the
CC   tat or rev genes and is especially targeted to the long terminal repeat
CC   or the polypurine tract, the central DNA flap, Nef, NCp7 or the gag slice
CC   site, at the RNA level. The conjugate has the structure transport
CC   mediator-addressing protein-PNA, particularly with a spacer (e.g.
CC   polylysine or a synthetic polymer) between addressing protein and PNA.
CC   The conjugate of the invention has anti-HIV activity. The transport
CC   mediator/addressing protein combination provide rapid and efficient
CC   transport of PNA to the nucleus and PNA is resistant to proteases and
CC   nucleases. The conjugate can be used in both early and late stages of
CC   infection. This sequence represents a fragment of HIV-1 LTR region used
CC   to construct PNA's used in the method of the invention.

PT   Human proliferating cell nuclear antigen 13 and encoded polynucleotide,
PT   used in diagnosis and treatment of malignant tumors, hemopathy, human
PT   immunodeficiency virus infection, immunological diseases and
PT   inflammation.
XX
PS   Example 3; Page 12; 35pp; Chinese.
XX
CC   The invention relates to an isolated polypeptide of human proliferating
CC   cell nuclear antigen (PCNA) 13. This polypeptide and its related
CC   polynucleotide are applicable in diagnosis and treatment of tumours,
CC   transfusion reaction, haemopathy, graft immune rejection, development
CC   disease, hereditary disease, HIV infection and inflammation. Regulators
CC   of the polypeptide activity or expression that can mimic, promote,
CC   antagonise or inhibit human PCNA 13 can be used for this purpose, and
CC   also an antibody that binds specifically to the polypeptide. A method for
CC   detecting diseases or disease susceptibility relating to the polypeptide
CC   involves measuring the expression dose of the polypeptide, determining
CC   the polypeptide activity, or detecting the polypeptide expression dose
CC   caused by the polynucleotide that has abnormal activity due to a
CC   polynucleotide mutation. The polynucleotide can be used to supply primers
CC   for nucleic acid amplification and probes for hybridisation reactions, or
CC   in producing gene chips or microarrays. This sequence represents a
CC   reverse-transcription PCR (RT-PCR) primer used for isolation of cDNA
CC   encoding human PCNA 13

PT   Identifying extendible primers for use in identification, or
PT   classification of a nucleic acid of an organism, allele or gene such as
PT   class 1/2 HLA comprises identifying all possible nucleotide sequences of
PT   specific length.
XX
PS   Claim 14; Page 57; 66pp; English.
XX
CC   The present invention provides a method for identifying a set of
CC   extendible primers which can be used in the identification, typing and
CC   classification of genes. This can then be used to predict protein
CC   sequence and structure, in organ donation to match the organ with the
CC   receiver, and to identify bacteria in a sample. The method can be used to
CC   type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC   particular

PT   New oligonucleotide useful for treating and preventing cancer.
XX
PS   Example 1; Col 12; 12pp; English.
XX
CC   The invention provides methods for inhibiting cell growth by providing a
CC   growing cell with an oligonucleotide capable of binding to a chromosomal
CC   binding site for p53 protein. Sequences AAX89362, AAX89363 and AAX89366
CC   represent oligonucleotides that are derived from the sequence AAX89355.
CC   The oligonucleotides are used for inhibiting mammalian cellular
CC   replication and the treatment and prevention of cancer in a human. The
CC   oligonucleotides can be used in vitro to inhibit the growth of cultured
CC   mammalian cells e.g. human, monkey, mouse, rat and hamster cells which
CC   have chromosomal DNA encoding a binding site for p53 protein. Sequences
CC   AAX89356-366 represent oligonucleotides that are based on chromosomal
CC   binding sites for p53 protein

PT   Composition for treating cancer comprises an oligonucleotide that binds a
PT   chromosomal binding site for p53.
XX
PS   Example 1; Page 7; 13pp; English.
XX
CC   The invention relates to composition comprising an oligonucleotide that
CC   can bind a chromosomal binding site for p53 protein, and a
CC   pharmaceutically acceptable carrier. The composition is useful for
CC   inhibiting mammalian (e.g. human, ape, monkey, cow, mouse, rat, hamster,
CC   rabbit, cat, sheep or bull, dog, horse) cell growth and replication,
CC   especially cancer (e.g. carcinoma, sarcoma, breast cancer, adrenal cortex
CC   cancer, colon cancer, bladder cancer, prostate cancer, lung cancer or
CC   leukaemic cancer). The present sequence is human p53 protein chromosomal
CC   binding region scrambled control oligonucleotide Hoog3

PT   Ribozymes having modified bases and methods for producing them - for use
PT   in inhibiting disease related genes.
XX
PS   Claim 2; Page 175; 407pp; English.
XX
CC   The present sequence represents a preferred target sequence for an
CC   enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC   nucleotide base position indicated in the DE line. Regions of the mRNA
CC   that do not form secondary folding structures and that contain potential
CC   hammerhead and hairpin ribozyme cleavage sites were identified by
CC   computer analysis. Ribozymes directed against these mRNA sequences were
CC   designed and synthesised with modifications that improve their nuclease
CC   resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC   inhibit ICAM-1 expression, making them useful for reducing transplant
CC   rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC   asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC   correct PI field.)

PT   Ribozymes having modified bases and methods for producing them - for use
PT   in inhibiting disease related genes.
XX
PS   Claim 2; Page 175; 407pp; English.
XX
CC   The present sequence represents a preferred target sequence for an
CC   enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC   nucleotide base position indicated in the DE line. Regions of the mRNA
CC   that do not form secondary folding structures and that contain potential
CC   hammerhead and hairpin ribozyme cleavage sites were identified by
CC   computer analysis. Ribozymes directed against these mRNA sequences were
CC   designed and synthesised with modifications that improve their nuclease
CC   resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC   inhibit ICAM-1 expression, making them useful for reducing transplant
CC   rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC   asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC   correct PI field.)

PT   Synthesis of N3' to P5' phosphoramidate oligo:nucleotide - by reacting
PT   immobilised 3'-amino nucleotide with new amino:nucleoside 5'-
PT   phosphoramidite then oxidation, useful as research, diagnostic and
PT   therapeutic agents.
XX
PS   Disclosure; Page 28; 60pp; English.
XX
CC   A new method is provided for the synthesis of oligonucleotides having N3'
CC   ->P5' phosphoramidate linkages. The method comprises (a) attaching a 3'-
CC   protected amino nucleoside to a solid support; (b) deprotecting the 3'-
CC   amino; (c) reacting with a 3'-protected aminonucleoside-5'-
CC   phosphoramidite monomer to form an internucleoside N3'-> P5'
CC   phosphoramidite link; (d) oxidising this link to phosphoramidate; and
CC   optionally repeating steps (b)-(d) until the required oligonucleotide is
CC   completed. This method provides better yields with lower reagent
CC   consumption than known processes, and can be operated on a large scale.
CC   The obtained oligos, containing phosphoramidate linkages, have favourable
CC   binding properties, nuclease resistance and solubility, and are useful as
CC   research, diagnostic and therapeutic agents. The present sequence is an
CC   example of an oligonucleotide in which N3'->P5' phosphoramidate linkages
CC   have been introduced by the new method. (Updated on 25-MAR-2003 to
CC   correct PR field.)

CC   protected amino nucleoside to a solid support; (b) deprotecting the 3'-
CC   amino; (c) reacting with a 3'-protected aminonucleoside-5'-
CC   phosphoramidite monomer to form an internucleoside N3'-> P5'
CC   phosphoramidite link; (d) oxidising this link to phosphoramidate; and
CC   optionally repeating steps (b)-(d) until the required oligonucleotide is
CC   completed. This method provides better yields with lower reagent
CC   consumption than known processes, and can be operated on a large scale.
CC   The obtained oligos, containing phosphoramidate linkages, have favourable
CC   binding properties, nuclease resistance and solubility, and are useful as
CC   research, diagnostic and therapeutic agents. The present sequence is an
CC   example of an oligonucleotide in which N3'->P5' phosphoramidate linkages
CC   have been introduced by the new method. (Updated on 25-MAR-2003 to
CC   correct PR field.)

PT   New release tag compounds for detecting target molecule(s) - comprising a
PT   reactive group, a release group and a releasable non-volatile mass label
PT   detectable by mass spectrometry.
XX
PS   Example 3; Page 92; 170pp; English.
XX
CC   The sequence is that of an oligonucleotide primer which was produced as
CC   part of an oligonucleotide peptide conjugate as an example of a release
CC   tag compound (RTC). These comprise a reactive group, a release group and
CC   a non-volatile mass label comprising a synthetic polymer or biopolymer
CC   detectable by mass spectrometry. The RTCs can be used as probes for the
CC   detection of TMs. They can be used for e.g. identification of gene
CC   sequences, identification of non-coding nucleotide sequences,
CC   identification of mutations within a gene or protein sequence, detection
CC   of metals, detection of toxins, detection of receptors on an organism or
CC   a cell, characterisation of antibody-antigen interactions, enzyme-
CC   substrate interactions and characterisation of ligand interactions.
CC   Multiplex applications include multiple pathogen diagnostics, multigene
CC   genetic polymorphism screening, single nucleotide polymorphism (SNP)
CC   genotyping, clone and gene mapping, and gene expression analysis. The
CC   RTCs permit the ready detection of releasable mass labels by mass
CC   spectroscopy. The releasable mass labels permit the multiplexing of tens,
CC   hundreds and perhaps even thousands of different mass labels that can be
CC   used to uniquely identify each desired target

PT   Separation of electrically charged target molecules - by capillary
PT   affinity gel electrophoresis using polymer-gel to which receptors for
PT   target molecules are bound.
XX
PS   Example A1; Page 22; 41pp; English.
XX
CC   This sequence represents an oligonucleotide receptor molecule covalently
CC   bound to a polyacrylamide gel via a linking group. The invention relates
CC   to selective separation of electrically charged target molecules in an
CC   analytical mixture. It comprises capillary affinity gel electrophoresis
CC   using a capillary tube which is at least partly filled with a polymer
CC   gel. Receptors for target molecules are covalently bound to the polymer.
CC   An electric field of at least 50 volts/cm is applied. The capillary tube
CC   is charged with the analytical mixture. In a first separation stage, the
CC   target molecules in the mixture are bound to the receptors and the
CC   remaining components are eluted, optionally whilst splitting open. In a
CC   second stage, the elution conditions are changed, optionally in stages,
CC   so that the affinity of the target molecules for the receptor is
CC   eliminated and the target molecules are eluted and detected, optionally
CC   whilst splitting open. The process is useful for selective separation
CC   and/or determination of charged organic compounds, such as
CC   oligonucleotides, peptides or carbohydrates. It may be used, e.g. for
CC   isolation of specific proteins and DNA molecules, purification of
CC   antibodies, analysis of antisense compounds or screening for enzyme
CC   inhibitors. The process achieves higher resolution and selectivity than
CC   prior art processes, especially in the case of complex biological
CC   analytical mixtures. It has high sensitivity, even with small amounts of
CC   samples. The derivatised polymers may be synthesised specifically using
CC   standard methods

PT   New 3'-protected-amino-nucleoside-5'-phosphoramidite monomers - used in
PT   the synthesis of oligo-nucleotide(s).
XX
PS   Example 10; Col 33; 34pp; English.
XX
CC   This sequence represents an example of an oligonucleotide containing
CC   novel 3'-amino-5'-phosphoramidite nucleoside of the invention. The
CC   sequence is generated synthetically by using an amine-exchange reaction
CC   of phosphoramidites in which a deprotected 3'-amino group of an
CC   oligonucleotide chain is exchanged for the amino portion of a 5'-
CC   phosphoramidite with a protected 3' amino group. The resulting
CC   phosphoramidite internucleotide linkage is oxidised to form a stable
CC   protected phosphoramidate linkage

XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Disclosure; Page 540; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

XX
PS   Claim 1; Page 49; 123pp; English.
XX
CC   The present sequence represents the preferred target sequence of an
CC   enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC   the Hepatitis C virus (HCV) RNA sequence in the 3' non-core region. The
CC   HCV sequence was screened for optimal ribozyme target sites using a
CC   computer folding algorithm and regions of the mRNA which did not form
CC   secondary folding structures and contained potential ribozyme cleavage
CC   sites were identified. Ribozymes were synthesised to target these sites
CC   and their activities optimised by either varying the length of the
CC   binding arms or by modification to prevent degradation by nucleases. The
CC   ribozymes of the invention inhibit gene expression and/or viral
CC   replication, and are used to treat diseases associated with Hepatitis C
CC   virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular
CC   carcinoma. The ribozymes may be used in combination with interferon to
CC   treat HCV infection, other infectious diseases, autoimmune diseases, and
CC   cancer

PT hepatitis C infection.
XX
PS Claim 1; Page 102; 123pp; English.
XX
CC The present sequence represents the preferred target sequence of an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the Hepatitis C virus (HCV) RNA sequence at the base position given in
CC the descriptor line. The HCV sequence was screened for optimal ribozyme
CC target sites using a computer folding algorithm and regions of the mRNA
CC which did not form secondary folding structures and contained potential
CC ribozyme cleavage sites were identified. Ribozymes were synthesised to
CC target these sites and their activities optimised by either varying the
CC length of the binding arms or by modification to prevent degradation by
CC nucleases. The ribozymes of the invention inhibit gene expression and/or
CC viral replication, and are used to treat diseases associated with
CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and
CC hepatocellular carcinoma. The ribozymes may be used in combination with
CC interferon to treat HCV infection, other infectious diseases, autoimmune
CC diseases, and cancer

PT New DNA encoding endo-beta-mannanase from coffee, used e.g. in
PT pharmaceutical, cosmetic or food compositions to hydrolyze polymannans.
XX
PS Disclosure; Page 32; 41pp; French.
XX
CC PCR primers AAA46501-02 were used to amplify DNA encoding an endo-beta-
CC mannanase enzyme, which is involved in the hydrolysis of polysaccharides
CC that consist of molecules of mannan, either simple or branched, linked
CC together by beta(1-4) bonds. The mannanase polynucleotide sequence is
CC used for in vivo modification of the coffee endo-beta-mannanase gene. It
CC is also used to produce transgenic plant cells (especially coffee cells)
CC which have modified properties of mannan polysaccharide, and thus altered
CC flavour or structure. The enzyme is used for modification, degradation or
CC synthesis of mannan polysaccharides in vitro, particularly to treat
CC coffee beans to increase the percentage of dry matter extraction, and
CC thus reduce the quantity of sediment

XX
PS   Disclosure; Page 44; 152pp; English.
XX
CC   The present primer was used to reverse transcribe human RNA, from which a
CC   cDNA sequence encoding a protein with heparanase catalytic activity was
CC   amplified. The heparanase (hpa) polynucleotide is useful in gene therapy,
CC   particularly in treating tumour, inflammation or autoimmunity.
CC   Particularly, the polynucleotide is useful in modulating the
CC   bioavailability of heparin-binding growth factors, cellular responses to
CC   heparin-binding growth factors (e.g. bFGF) and cytokines (e.g.
CC   interleukin (IL)-8), cell interaction with plasma lipoproteins, cellular
CC   susceptibility to certain viral and some bacterial and protozoa
CC   infections, or disintegration of neurodegenerative plaques. The
CC   polynucleotide is also useful in wound healing (e.g. thermal, chemical or
CC   radiation burns), and in the treatment of angiogenesis, restenosis,
CC   atherosclerosis, inflammation, neurodegenerative diseases (Gerstmann-
CC   Straussler Syndrome or Creutzfeldt-Jakob disease), and some viral,
CC   bacterial or protozoa infections

XX
PS Disclosure; Page 20; 42pp; English.
XX
CC The invention provides modified nucleomonomers of specified formula and
CC their pharmaceutically acceptable salts. The nucleomonomers are used as
CC monomers in oligomers, which are used in pharmaceutical compositions to
CC inhibit expression of nucleic acid molecules including DNA and RNA in
CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC interleukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC infections and bacterial infections (see AAA07786 for details of other
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC target nucleic acid sequences, are physiologically stable, non-toxic and
CC able to penetrate into cells while maintaining stringent base pair
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC single- or double-stranded target nucleic acid binding activity to form
CC duplexes, triplexes or other forms of stable association. Sequences

XX
CC   The invention provides modified nucleomonomers of specified formula and
CC   their pharmaceutically acceptable salts. The nucleomonomers are used as
CC   monomers in oligomers, which are used in pharmaceutical compositions to
CC   inhibit expression of nucleic acid molecules including DNA and RNA in
CC   cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC   infected cells. They are used in oligomers for gene regulation, antisense
CC   technology, diagnostic applications to detect target sequences in
CC   biological samples such as those containing pathogenic bacteria, fungi
CC   and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC   encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC   molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC   interleukins associated with pathological conditions such as inflammatory
CC   conditions, cardiovascular disorders, immune reactions, cancer, viral
CC   infections and bacterial infections (see AAA07786 for details of other
CC   uses for which the oligomers are suitable for). Oligomers comprising the
CC   nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC   target nucleic acid sequences, are physiologically stable, non-toxic and
CC   able to penetrate into cells while maintaining stringent base pair
CC   fidelity for target DNA sequences. The oligomers demonstrate significant
CC   single- or double-stranded target nucleic acid binding activity to form
CC   duplexes, triplexes or other forms of stable association. Sequences
CC   AAA07820-834 represent sequences forming triplex oligomers

XX
CC   The invention provides modified nucleomonomers of specified formula and
CC   their pharmaceutically acceptable salts. The nucleomonomers are used as
CC   monomers in oligomers, which are used in pharmaceutical compositions to
CC   inhibit expression of nucleic acid molecules including DNA and RNA in
CC   cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC   infected cells. They are used in oligomers for gene regulation, antisense
CC   technology, diagnostic applications to detect target sequences in
CC   biological samples such as those containing pathogenic bacteria, fungi
CC   and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC   encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
```

```
CC   molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC   interleukins associated with pathological conditions such as inflammatory
CC   conditions, cardiovascular disorders, immune reactions, cancer, viral
CC   infections and bacterial infections (see AAA07786 for details of other
CC   uses for which the oligomers are suitable for). Oligomers comprising the
CC   nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC   target nucleic acid sequences, are physiologically stable, non-toxic and
CC   able to penetrate into cells while maintaining stringent base pair
CC   fidelity for target DNA sequences. The oligomers demonstrate significant
CC   single- or double-stranded target nucleic acid binding activity to form

XX
CC   The invention provides modified nucleomonomers of specified formula and
CC   their pharmaceutically acceptable salts. The nucleomonomers are used as
CC   monomers in oligomers, which are used in pharmaceutical compositions to
CC   inhibit expression of nucleic acid molecules including DNA and RNA in
CC   cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC   infected cells. They are used in oligomers for gene regulation, antisense
CC   technology, diagnostic applications to detect target sequences in
CC   biological samples such as those containing pathogenic bacteria, fungi
CC   and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC   encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC   molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC   interleukins associated with pathological conditions such as inflammatory
CC   conditions, cardiovascular disorders, immune reactions, cancer, viral
CC   infections and bacterial infections (see AAA07786 for details of other
CC   uses for which the oligomers are suitable for). Oligomers comprising the
CC   nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC   target nucleic acid sequences, are physiologically stable, non-toxic and
CC   able to penetrate into cells while maintaining stringent base pair
CC   fidelity for target DNA sequences. The oligomers demonstrate significant
CC   single- or double-stranded target nucleic acid binding activity to form
CC   duplexes, triplexes or other forms of stable association. Sequences

XX
CC   The invention provides modified nucleomonomers of specified formula and
CC   their pharmaceutically acceptable salts. The nucleomonomers are used as
CC   monomers in oligomers, which are used in pharmaceutical compositions to
CC   inhibit expression of nucleic acid molecules including DNA and RNA in
CC   cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC   infected cells. They are used in oligomers for gene regulation, antisense
CC   technology, diagnostic applications to detect target sequences in
CC   biological samples such as those containing pathogenic bacteria, fungi
CC   and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC   encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC   molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC   interleukins associated with pathological conditions such as inflammatory
CC   conditions, cardiovascular disorders, immune reactions, cancer, viral
CC   infections and bacterial infections (see AAA07786 for details of other
CC   uses for which the oligomers are suitable for). Oligomers comprising the
CC   nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC   target nucleic acid sequences, are physiologically stable, non-toxic and
CC   able to penetrate into cells while maintaining stringent base pair
CC   fidelity for target DNA sequences. The oligomers demonstrate significant
CC   single- or double-stranded target nucleic acid binding activity to form
CC   duplexes, triplexes or other forms of stable association. Sequences
CC   AAA07788-803 represent oligonucleotides forming a third strand along with
CC   the duplex sequences

CC   and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC   encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC   molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC   interleukins associated with pathological conditions such as inflammatory
CC   conditions, cardiovascular disorders, immune reactions, cancer, viral
CC   infections and bacterial infections (see AAA07786 for details of other
CC   uses for which the oligomers are suitable for). Oligomers comprising the
CC   nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC   target nucleic acid sequences, are physiologically stable, non-toxic and
CC   able to penetrate into cells while maintaining stringent base pair
CC   fidelity for target DNA sequences. The oligomers demonstrate significant
CC   single- or double-stranded target nucleic acid binding activity to form
CC   duplexes, triplexes or other forms of stable association. Sequences
CC   AAA07788-803 represent oligonucleotides forming a third strand along with
CC   the duplex sequences

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 264; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   New conformationally restricted 3',5'-bridged nucleosides and
PT   oligonucleotides useful as antisense therapeutics or as gene-specific
PT   diagnostics.
XX
PS   Example 20; Col 16; 10pp; English.
XX
CC   The present sequence is an oligonucleotide containing 3'-C-amino-5'(S)-
CC   C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in
CC   the sequence were incorporated by phosphoramidite chemistry using a DNA
CC   synthesiser. Bicyclic sugar nucleosides are conformationally restricted
CC   3',5'-bridged nucleosides which can be used as building blocks for
CC   oligonucleotides. Oligonucleotides can be produced that have certain,
CC   desired, geometrical shapes and entropy advantages. They may have
CC   superior hybridisation to DNA and RNA, and excellent biological
CC   stability. The conformationally-modified oligonucleotides may be useful
CC   as antisense inhibitors of gene expression or as gene probes, and may
CC   therefore be used in antisense therapeutics or gene-specific diagnostics

PT   New conformationally restricted 3',5'-bridged nucleosides and
PT   oligonucleotides useful as antisense therapeutics or as gene-specific
PT   diagnostics.
XX
PS   Example 20; Col 15; 10pp; English.
XX
CC   The present sequence is an oligonucleotide containing 3'-C-amino-5'(R)-
CC   C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in
CC   the sequence were incorporated by phosphoramidite chemistry using a DNA
CC   synthesiser. Bicyclic sugar nucleosides are conformationally restricted
CC   3',5'-bridged nucleosides which can be used as building blocks for
CC   oligonucleotides. Oligonucleotides can be produced that have certain,
CC   desired, geometrical shapes and entropy advantages. They may have
CC   superior hybridisation to DNA and RNA, and excellent biological
CC   stability. The conformationally-modified oligonucleotides may be useful
CC   as antisense inhibitors of gene expression or as gene probes, and may
CC   therefore be used in antisense therapeutics or gene-specific diagnostics

PT   New hybridization probe for specific triplex formation with large double
PT   helices, useful e.g. for site-specific diagnostic cleavage, contains
PT   attached functional residue.
XX
PS   Example 1; Fig 3B; 20pp; English.
XX
CC   This invention relates to hybridisation probes which target a specific
CC   sequence within a large double-helical nucleic acid. The probe is
CC   complementary to the target sequence and contains at least one nucleotide
CC   with an attached molecule that is able to cleave double-helical DNA e.g.
CC   EDTA-Fe(II) (ethylenediaminetetraacetic acid-iron complex). The probes
CC   where the attached molecule is a label or compound that alters gene
CC   expression, are used for specific detection and/or cleavage of double-
CC   helical DNA, e.g. for diagnosis, for treatment of disease (particularly
CC   caused by viruses, genetic defects or oncogenes), for chromosomal
CC   analysis, and for the isolation and mapping of genes. The present
CC   sequence represents probe of the invention used in an example
CC   illustrating how the probe binds to and cleaves double stranded DNA

PT   Conjugate of oligonucleotide, minor groove binder and latent fluorophore,
PT   useful for detecting specific nucleic acids, e.g. for single-nucleotide
PT   mismatch discrimination.
XX
PS   Disclosure; Page 58; 105pp; English.
XX
CC   The present sequence is that of the oligonucleotide (ODN) component of an
CC   ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the
CC   invention. MGBs bind in a non-intercalating manner to the minor groove of
CC   non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly
CC   but in an intercalating manner, or lies in the minor groove, or is
CC   oriented in some other way to the DNA molecule by MGB, such that it
CC   becomes fluorescent (or its fluorescent properties change detectably).
CC   The conjugates are used as hybridisation probes and amplification primers
CC   for fluorescent detection of specifically hybridising sequences, for
CC   analysis or diagnosis, especially (real-time) PCR, for single-nucleotide
CC   mismatch discrimination, target or signal amplification, array-based
CC   assays and sequencing, including detection of double-stranded DNA by
CC   triplex formation. Many different targets can be detected a single
CC   reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate
CC   hybridisation-triggered fluorescence. Upon hybridisation to the
CC   complementary target sequence there was an increase in fluorescence
CC   yield, measured as the ratio of the fluorescence emitted by the hybrid
CC   between the ODN-MGB-LF conjugate and its target sequence to the
CC   fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,
CC   of 8.3

PT   Intermediate for oligonucleotide synthesis comprises partially hydrolysed
PT   cross-linked vinyl acetate copolymer loaded with nucleotide derivative.
XX
PS   Example 2; Page 5; 8pp; German.
XX
CC   This invention describes a novel chemical product comprising a partially
CC   hydrolysed cross-linked vinyl acetate copolymer carrier material loaded
CC   with nucleotide derivative(s). The product is an intermediate for the
CC   large (gram) scale solid phase synthesis of modified oligonucleotides
CC   useful e.g. as clinical diagnostics and therapeutics, e.g. for the
CC   treatment of AIDS and cancers. The presence of the partially hydrolysed
CC   copolymer facilitates the synthesis of larger amounts of oligonucleotides
CC   compared with the use of Merckogel (RTM; macroporous polyvinyl acetate)
CC   described in Nucleic Acid Res. Sympos. Ser. 31, p. 153, 1994.
CC   Oligonucleotides are obtained in very good quality and high yields, Also,
CC   the nucleosides do not display the reduced activity seen in some prior
CC   art procedures, less carrier material, reagents and solvent are required.
CC   Further, the carrier material is biodegradable and thus does not present
CC   disposal problems. It also swells uniformly in a range of solvents, which
CC   obviates expansion or contraction during use or solvent exchange.
CC   AAH20510-AAH20513 represent oligonucleotides containing modified
CC   deoxynucleotides which are used to illustrate the method of the invention

PT   Treating gastric acid disturbance by administering an oligonucleotide
PT   which modulates the activity of a polypeptide involved in gastric acid
PT   production or secretion.
XX
PS   Example 3; Page 148; 164pp; English.
XX
CC   The present invention provides oligonucleotides, and methods for their
CC   use, which are useful in modulating the action of proteins involved in
CC   gastric acid production. The target protein is preferably the histamine
CC   H2 receptor or one of the proteins which form part of the gastric proton
CC   pump. The sequences and methods of the invention are useful in the
CC   treatment of gastric reflux, gastritis, dyspepsia, stomach ulcers,
CC   duodenal ulcers and other gastric acid disturbances, most of which are
CC   caused by Helicobacter pylori

PT   New DNA-peptide nucleic acid chimeras, useful e.g. as antisense agents
PT   for treating e.g. cancer, also as diagnostic probes and primers.
XX
PS   Example 26; Page 40; 54pp; German.
XX
CC   This invention describes novel polyamide-oligonucleotide derivatives (I)
CC   and their physiologically acceptable salts of formula F((DNA)-Li)_q(PNA-
CC   Li)_r(DNA-Li)_s(PNA)_t)_xF' where q, r, s, t = 0 or 1, with the sum of
CC   two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
CC   (such as DNA or RNA or their known derivatives); Li = covalent linkage
CC   between DNA and PNA, i.e. a bond or a residue containing at least one
CC   atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure
CC   containing at least one nucleobase different from thymine; and F, F' =
CC   end groups and/or are connected through a covalent bond. The products of
CC   the invention have anticancer, antiproliferative, antiviral, hepatotropic
CC   and vasotropic activity and can be used for the inhibition of gene
CC   expression by antisense, ribozyme, sense, or triple-helix methods, or by
CC   binding to proteins (aptamers). (I) are used for treating diseases caused
CC   by viruses (human immune deficiency, herpes simplex, influenza, vesicular
CC   stomatitis, hepatitis B or papilloma), or mediated by integrins or cell-
CC   cell adhesion reactions, for treating cancer, or for inhibiting
CC   restenosis, particularly as antisense reagents. They are also useful in
CC   heterogeneous or homogeneous assays, as primers or probes, particularly
CC   where the target is amplified before being detected by hybridization, for
CC   diagnosis of genetic, malignant or pathogen-related diseases. (I) retain
CC   the increased affinity for complementary strands and better stability in
CC   serum, associated with conventional peptide nucleic acids (PNA), but lack
CC   the disadvantages, i.e. have improved cellular uptake, do not aggregate
CC   in aqueous solution, and have reduced affinity for purification
CC   materials, reduced cytotoxicity, better sequence specificity. They are
CC   more active than either DNA or PNA oligomers. When used as probes, (I)
CC   show different responses to base-pair mismatches in the DNA and PNA
CC   segments, allowing better discrimination between pathogenic and non-
CC   pathogenic conditions such as the transition from proto-oncogene to
CC   oncogene, also, when used as primers, with the PNA segment at the 5'-end,
CC   they produce amplicons resistant to 5'-exonuclease, allowing this enzyme
CC   to be used to eliminate RNA or DNA primers. The DNA component allows
CC   additional reactions not possible with PNA alone, e.g. 3'-tailing and (I)
CC   may be incorporated into a gene. AAH49208-AAH49264 represent
CC   oligonucleotides used to illustrate the method of the invention

PT   Oligonucleotides analogs useful in detection, separation and purification
PT   of nucleic acid molecules, comprise monomers, dimers and oligomers.
XX
PS   Example 20; Page 123; 197pp; English.
XX
CC   This invention relates to oligonucleotide analogues comprising a protein
CC   nucleic acid molecule (PNA) monomer. They are used in the detection and
CC   separation of nucleic acid molecules and as probes, primers, linkers,
CC   adapters and antisense agents on solid supports. Modifications enhance
CC   their use as capture and detection probes e.g. by the incorporation of
CC   biotin, digoxigenen, radioisotopes, fluorescent labels such as
CC   fluorescein and reporter molecules such as alkaline phosphatase. They are
CC   also used for enhancing or inhibiting the activity of an enzyme or
CC   cellular activity. The compounds are stable to nucleases and proteases,
CC   have high affinity, binding specificity and solubility. The polyamide
CC   backbone of PNAs is resistant to both nucleases and proteases. PNAs bind
CC   nucleic acid molecules with greater affinity than DNA or RNA
CC   concentration. The compounds are relatively simple to synthesize and are
CC   used in a wide variety of applications. This sequence represents a DNA
CC   oligomer which is used to represent the effect of single base mismatches
CC   on oligonucleotides

PT   Oligonucleotides analogs useful in detection, separation and purification
PT   of nucleic acid molecules, comprise monomers, dimers and oligomers.
XX
PS   Example 20; Page 123; 197pp; English.
XX
CC   This invention relates to oligonucleotide analogues comprising a protein
CC   nucleic acid molecule (PNA) monomer. They are used in the detection and
CC   separation of nucleic acid molecules and as probes, primers, linkers,
CC   adapters and antisense agents on solid supports. Modifications enhance
CC   their use as capture and detection probes e.g. by the incorporation of
CC   biotin, digoxigenen, radioisotopes, fluorescent labels such as
CC   fluorescein and reporter molecules such as alkaline phosphatase. They are
CC   also used for enhancing or inhibiting the activity of an enzyme or
CC   cellular activity. The compounds are stable to nucleases and proteases,
CC   have high affinity, binding specificity and solubility. The polyamide
CC   backbone of PNAs is resistant to both nucleases and proteases. PNAs bind
CC   nucleic acid molecules with greater affinity than DNA or RNA
CC   concentration. The compounds are relatively simple to synthesize and are
CC   used in a wide variety of applications. This sequence represents a DNA

XX
PS   Claim 11; Fig 5; 62pp; German.
XX
CC   The present invention relates to a method of detecting mutations in a
```

```
CC   nucleic acid by amplifying the nucleic acid to produce a double-stranded
CC   amplicon, in vitro transcription and translation of this amplicon, and
CC   detection of the translated protein. The primers used for amplification
CC   are designed to produce an amplicon that is translatable and allows
CC   differentiation between translation products of wild-type and mutated
CC   nucleic acids. The method is used to detect mutations in tumour
CC   suppressor genes, for (early) diagnosis, monitoring and characterisation
CC   of tumours (especially of bladder and intestines) and in the germ line
CC   (using nucleic acids from embryos or blood cells). A new multi-tag vector
CC   is used to detect or verify the reading frame of a nucleic acid cloned in
CC   it, and to determine the suitability of detectable peptides for analysis
CC   and/or purification of a recombinant protein, expressed from a sequence
CC   cloned in the vector. The present sequence encodes a tag peptide and was
CC   used in the invention

PT   Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral
PT   reverse transcriptase comprises at the 2'-O position of the
PT   oligoribonucleotide, a hydrophobic carrier reagent containing a poly
PT   substituted phenyl compound.
XX
PS   Example 3; Col 24; 56pp; English.
XX
CC   The invention relates to derivatised antisense oligoribonucleotides with
CC   enhanced membrane permeability and stability. The derivatised antisense
CC   oligoribonucleotide complementary to a sequence of nucleotides found in a
CC   virus or a cell is useful for inhibiting e.g., viral reverse
CC   transcriptase. Derivatised antisense oligoribonucleotide is conjugated at
CC   the 2'-O position with a hydrophobic carrier reagent containing a poly
CC   substituted phenyl compound. The derivatised oligoribonucleotides are
CC   used to decrease the expression of oncogenes and thereby decrease the
CC   expression of cancer cells which rely upon oncogene expression for their
CC   phenotypic and pathological properties. The oligoribonucleotides are also
CC   used for increasing the effectiveness of antisense oligonucleotide
CC   targetted to a gene associated with a disease or a condition in an
CC   animal. To alter gene transcription and/or translation for any gene or
CC   gene segment responsible for expression, to inhibit viral reverse
CC   transcriptase, to inhibit the expression of leukaemia virus, hepatitis
CC   virus, oncogenes and human immunodeficiency virus. The present sequence
CC   is retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment
CC   which is used in the treatment of moloney murine leukaemia virus (MuLV)
CC   in mammals. (Updated on 07-AUG-2003 to correct OS field.) (Updated on 29-

PT   Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral
PT   reverse transcriptase comprises at the 2'-O position of the
PT   oligoribonucleotide, a hydrophobic carrier reagent containing a poly
PT   substituted phenyl compound.
XX
PS   Example 3; Col 24; 56pp; English.
XX
CC   The invention relates to derivatised antisense oligoribonucleotides with
CC   enhanced membrane permeability and stability. The derivatised antisense
CC   oligoribonucleotide complementary to a sequence of nucleotides found in a
CC   virus or a cell is useful for inhibiting e.g., viral reverse
CC   transcriptase. Derivatised antisense oligoribonucleotide is conjugated at
CC   the 2'-O position with a hydrophobic carrier reagent containing a poly
CC   substituted phenyl compound. The derivatised oligoribonucleotides are
CC   used to decrease the expression of oncogenes and thereby decrease the
CC   expression of cancer cells which rely upon oncogene expression for their
CC   phenotypic and pathological properties. The oligoribonucleotides are also
CC   used for increasing the effectiveness of antisense oligonucleotide
CC   targetted to a gene associated with a disease or a condition in an
CC   animal. To alter gene transcription and/or translation for any gene or
CC   gene segment responsible for expression, to inhibit viral reverse
CC   transcriptase, to inhibit the expression of leukaemia virus, hepatitis
CC   virus, oncogenes and human immunodeficiency virus. The present sequence
CC   is retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment
CC   which is used in the treatment of moloney murine leukaemia virus (MuLV)
CC   in mammals. (Updated on 07-AUG-2003 to correct OS field.) (Updated on 29-
CC   AUG-2003 to standardise OS field)

PT   New vectors comprising operably linked DNA fragments having an origin of
PT   replication, a selectable marker and a chimeric DNA construct, useful for
PT   silencing target nucleic acids and for producing large amounts of double-
PT   stranded RNA.
XX
PS   Claim 14; Page 74; 104pp; English.
XX
CC   The present invention describes a vector (I) comprising operably linked
CC   DNA fragments having: (a) origin of replication allowing replication in a
CC   recipient cell, preferably in bacteria such as Escherichia coli; (b)
CC   selectable marker region capable of being expressed in the recipient cell
CC   ; and (c) a chimeric DNA construct comprising: (i) promoter or promoter
CC   region capable of being recognized by RNA polymerases of a eukaryotic
CC   cell or by prokaryotic RNA polymerase; (ii) first, second, third and
CC   fourth recombination sites; (iii) 3' transcription terminating and
CC   polyadenylation region functional in the eukaryotic cell. The first and
CC   fourth recombination sites, or the second and third recombination sites
CC   are capable of reacting with a same recombination site, and preferably
CC   are identical. The first and second recombination sites, or the third and
CC   fourth recombination sites, do not recombine with each other or with a
CC   same recombination site. The vector is useful for producing large amounts
CC   of double-stranded RNA which can be used for silencing target nucleic
CC   acid sequences. The vectors can also be used to convert a DNA fragment
CC   into an inverted repeat structure. Plants transformed with a vector from
CC   the present invention can be used in a conventional breeding scheme to
CC   produce more plants with the same characteristics or to introduce a
CC   chimeric gene for reduction of the phenotypic expression of nucleic
CC   acids. The present sequence represents an acceptor vector nucleotide
CC   sequence from the present invention

PT   New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
PT   replication and are useful to treat hepatitis C virus infections and
PT   cirrhosis, liver failure or hepatocellular carcinoma.
XX
PS   Claim 1; Page 21; 80pp; English.
XX
CC   The present invention relates to enzymatic nucleic acids which
CC   specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC   enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC   (HP) motif where the binding arms comprise sequences complementary to one
CC   of the substrate sequences defined in the specification. The HCV
CC   ribozymes are useful for modulating the expression and/or replication of
CC   HCV. They can be used to treat cirrhosis, liver failure and/or
CC   hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC   a condition associated with HCV infection in conjunction with one or more
CC   other drug therapies, particularly type I interferon, especially
CC   interferon alpha, beta or gamma or consensus interferon. The present
CC   sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:

XX
CC   The present sequence is of a hydrazine treated hydrazide precursor
CC   phosphoramidite 15-mer, designated oligo O35, which was produced in an
CC   example from the invention and which includes a synthetic branching
CC   amidite compound. The invention describes an improved process for
CC   immobilisation of macromolecules including DNA, RNA, peptide nucleic
CC   acids, pyranosyl-RNA and peptides, especially macromolecules containing
CC   multiple reactive sites, to a substrate surface or other conjugation
CC   target. It also describes the preparation of oligos containing one or
CC   more hydrazides, which can be used for conjugation to surface binding
CC   moieties, or for other conjugation reactions. The process is useful e.g.
CC   in nucleic acid hybridisation based assays, DNA chip technology and
CC   biosensor applications

PS   Example 12; Page 57; 120pp; English.
XX
CC   The present sequence is of an amino-C6-modified and Cy3 dye labeled T15
CC   oligonucleotide that was used in a comparison of hydrazine and amine
CC   attachment moieties on active ester surfaces in an example from the
CC   invention. The invention describes an improved process for immobilisation
CC   of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-
CC   RNA and peptides, especially macromolecules containing multiple reactive
CC   sites, to a substrate surface or other conjugation target. It also
CC   describes the preparation of oligos containing one or more hydrazides,
CC   which can be used for conjugation to surface binding moieties, or for
CC   other conjugation reactions. The process is useful e.g. in nucleic acid
CC   hybridisation based assays, DNA chip technology and biosensor
CC   applications

PT   A triple-helix comprising a double helical nucleic acid (DHNA) and an
PT   oligonucleotide which binds in parallel and antiparallel orientation,
PT   respectively, for targetting sequences on alternate strands of DHNA to
PT   control gene expression.
XX
PS   Example 1; Fig 3B; 108pp; English.
XX
CC   The present invention relates to methods and oligonucleotides for forming
CC   a triple-helix comprising a double helical nucleic acid comprising first
CC   and second substantially complementary strands, and an oligonucleotide
CC   bound to a purine-rich target sequence within the double helical nucleic
CC   acid, where the oligonucleotide binds in a parallel and antiparallel
CC   orientation, respectively, to target sequences on alternate strands of
CC   the double helical nucleic acid. The method has therapeutic applications,
CC   where gene expression is controlled by selective triple-helix formation
CC   within expression regulatory sequences of a target gene. The
CC   oligonucleotides can be used to form triple-helices, and are useful to
CC   detect the presence or absence of specific sequences within genomic DNA
CC   for diagnostic and therapeutic purposes. The oligonucleotides can be
CC   selected to specifically bind to pathogenic double-stranded DNA including
CC   specific sequences required by pathogenic bacteria or viruses for
CC   replication or virulence, reducing their pathogenicity. Alternatively,
CC   the oligonucleotide can be chosen to target a unique sequence of the
CC   pathogen which is not found in the genome of pathogen's host. The
CC   oligonucleotides can be used in cancer treatment by way of triple-helix
CC   suppression of specific oncogenes including those of endogenous or viral
CC   origin. Such therapeutic oligonucleotides are capable of forming triple-
CC   helices with such sequences in cancerous cells containing the activated
CC   oncogene, so preferentially killing or repressing the cancer causing
CC   cell. The present sequence represents an oligonucleotide used in the
CC   methods of the present invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 11561; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT Cleaving single-stranded nucleic acid sequences at a desired location by
PT contacting the nucleic acid with an single strand oligonucleotide
PT complementary to a nucleic acid region where cleavage is desired.
XX
PS Disclosure; Page 481; 485pp; English.
XX
CC The present invention describes a method for cleaving single-stranded
CC nucleic acid sequences at a desired location. Also described: (1) methods
CC for displaying or expressing a member of a diverse family of peptides,
CC polypeptides or proteins on the surface of a genetic package and
CC collectively displaying at least a part of the diversity of the family,
CC where the displayed or expressed peptide, polypeptide or protein is
CC encoded at least in part by a nucleic acid that has been cleaved at a
CC desired location; (2) a method for preparing single-stranded nucleic
CC acids; (3) a method for preparing a library comprising a collection of
CC genetic packages that display a member of a diverse family of peptides,
CC polypeptides or proteins and that collectively display at least a portion
CC of the family; (4) a vector comprising a DNA sequence encoding an
CC antibody variable region linked to a version of PIII anchor which does
CC not mediate infection of phage particles, and wild-type gene III; (5) a
CC method for producing a population or a library of immunoglobulin genes;
CC and (6) a library of immunoglobulins that comprise members having at
CC least one variable domain in which at least one of CDR1 and CDR2 contain
CC synthetic diversity and CDR3 diversity is captured from B cells. The
CC method is useful for cleaving single-stranded nucleic acid sequences at a
CC desired location, which can be subsequently used to produce libraries or
CC genetic packages that display and/or express a diverse family of
CC peptides, polypeptides or proteins. ABZ36912 to ABZ37510 and ABP55464 to
CC ABP55499 represent sequences used in the exemplification of the present
CC invention

PT Cleaving single-stranded nucleic acid sequences at a desired location by
PT contacting the nucleic acid with an single strand oligonucleotide
PT complementary to a nucleic acid region where cleavage is desired.
XX
PS Disclosure; Page 481; 485pp; English.
XX
CC The present invention describes a method for cleaving single-stranded
CC nucleic acid sequences at a desired location. Also described: (1) methods
CC for displaying or expressing a member of a diverse family of peptides,
CC polypeptides or proteins on the surface of a genetic package and
CC collectively displaying at least a part of the diversity of the family,
CC where the displayed or expressed peptide, polypeptide or protein is
CC encoded at least in part by a nucleic acid that has been cleaved at a
CC desired location; (2) a method for preparing single-stranded nucleic
CC acids; (3) a method for preparing a library comprising a collection of
CC genetic packages that display a member of a diverse family of peptides,
CC polypeptides or proteins and that collectively display at least a portion
CC of the family; (4) a vector comprising a DNA sequence encoding an
CC antibody variable region linked to a version of PIII anchor which does
CC not mediate infection of phage particles, and wild-type gene III; (5) a
CC method for producing a population or a library of immunoglobulin genes;
CC and (6) a library of immunoglobulins that comprise members having at
CC least one variable domain in which at least one of CDR1 and CDR2 contain
CC synthetic diversity and CDR3 diversity is captured from B cells. The
CC method is useful for cleaving single-stranded nucleic acid sequences at a
CC desired location, which can be subsequently used to produce libraries or
CC genetic packages that display and/or express a diverse family of
CC peptides, polypeptides or proteins. ABZ36912 to ABZ37510 and ABP55464 to
CC ABP55499 represent sequences used in the exemplification of the present
CC invention

CC   The present sequence is that of the 5' end of a cDNA clone isolated from
CC   a cDNA library e.g. a mosquito antenna library. A clone was isolated
CC   using a method designed to rapidly array and normalize a complex cDNA
CC   library obtained from a target species. Clones are arrayed into multi-
CC   well plates. Each well contains 16 oligonucleotides (see ABV74137) with a
CC   5' polylinker, a poly-T run capable of binding cDNAs by their poly-A tail
CC   and a unique 3' sequence, which allows an anchored oligonucleotide in
CC   each well to selectively hybridise only to those cDNA clones with a
CC   complementary 5' end. The unique 3' key sequences are designed to give a
CC   comprehensive level of degeneracy since they are diverse and numerous
CC   enough to ensure that every possible cDNA sequence can be bound by an
CC   individual, specific oligonucleotide in a single well. The cDNA library
CC   is heated to denature the clones into single stranded DNA, and an aliquot
CC   is added to every well. The anchored oligonucleotide serves as the 3'
CC   primer in PCR, and the common 5' region present in every cDNA clone
CC   serves as the 5' priming site. Denaturing and washing leave anchored cDNA
CC   in each well. The library is now arrayed and normalised. The method was
CC   used to identify and isolate clones encoding G-protein coupled receptors,
CC   especially odourant receptors, and active effectors involved in the
CC   olfactory pathway of invertebrates and vertebrates, e.g. odourant binding
CC   proteins, or other olfactory or neuronal proteins. The identified
CC   receptors and proteins are useful for identifying compounds that reduce a
CC   target animal's sensitivity to odours, for manufacturing compounds or
CC   devices that mask odours, or trapping invertebrates with odourants.
CC   Semiochemicals (e.g. arometics or pheromone mimetics) can be developed
CC   with desirable effects on specific species, for the development of pest
CC   monitoring systems or non-toxic, species-specific pesticide alternatives,
CC   for controlling insect feeding and breeding behaviour, detecting the
CC   presence of small air-borne molecules, etc

PT   New oligonucleotide deprotection reagent useful for deprotecting
PT   oligonucleotide comprises an active methylene compound and an amine
PT   reagent.
XX
PS   Example 2; Page 25; 46pp; English.
XX
CC   The present invention provides a method for deprotection of an
CC   oligonucleotide. This involves reacting a protected oligonucleotide,
CC   which is preferably covalently attached to a solid support through a
CC   linkage, with a deprotection reagent comprising an active methylene
CC   compound and an amine reagent. The process and reagent minimise side-
CC   reactions leading to certain impurities that contaminate synthetic
CC   oligonucleotides. The present sequence is a T15 phosphoramidite
CC   oligonucleotide having a quencher moiety (Q) and minor groove binder
CC   (CDPI3) at the 3' end, which was synthesised in an example of the
CC   invention. This protected oligonucleotide was treated either with 15%
CC   ethanolic ammonia or with 3% diethylmalonate (DEM) dissolved in 15%
CC   ethanolic ammonia for 2 hours at 55 degrees C. HPLC analysis showed that
CC   deprotection without DEM yielded a complex mixture of products containing
CC   only 26.5% of the desired product. When DEM was used, 76.8% of the
CC   desired product was obtained

XX
PT   Hairpin sensor useful for detecting a target nucleotide sequence in a
PT   sample, comprises a hairpin loop assembly including a complementary probe
PT   and a quenchable fluorescing agent.
XX
PS   Example 2; Page 11; 16pp; English.
XX
CC   The invention discloses a hairpin sensor comprising a hairpin loop
CC   assembly including a complementary probe positioned between a first
CC   inverse repeat arm and a second inverse repeat arm, and a quenchable
CC   fluorescing agent joined, directly or indirectly, to the end of the
CC   second inverse repeat arm of the hairpin loop assembly opposite the
CC   complementary probe. Also claimed is a microarray comprising the hairpin
CC   sensor, where the end of the first inverse repeat arm opposite the
CC   complementary probe is bound, directly or indirectly, to a support, a kit
CC   for detecting a target nucleotide sequence in a sample comprising the
CC   hairpin sensor, and a support, and a hairpin sensor system, in which the
CC   particle is conductive or semi-conductive, including at least one of the
CC   above hairpin sensor assemblies. The hairpin sensor further comprises a
CC   functional group joined to the end of the first inverse repeat arm
CC   opposite the complementary probe, or first spacer opposite the first
CC   inverse repeat arm, the functional group selected from amino, carboxyl,
CC   thiol and hydroxyl. Further, the sensor comprises a ligand positioned
CC   between the second inverse repeat arm and the quenchable fluorescing
CC   agent, where the ligand is selected from mercapto, hydroxyl, amino,
CC   nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The
CC   second spacer is positioned between the second inverse repeat arm and the
CC   quenchable fluorescing agent which comprises a semiconductor nanocrystal
CC   or rhodamine B-labelled dye. Within the microarray the support is capable
CC   of accepting a charge. At least one hairpin sensor comprises two or more
CC   hairpin sensors. The two or more hairpin sensors include complementary
CC   probes that are the same or different and respective quenchable
CC   fluorescing agents that are the same or different. The two or more
CC   hairpin sensors are arranged in a spatially-defined pattern. The sensor
CC   and system are useful for detecting a target nucleotide sequence in a
CC   sample. Further, the method involves identifying the target nucleotide
CC   sequence by the location of the complementary probe to which the target
CC   nucleotide sequence binds. The two or more hairpin sensors include
CC   complementary probes or quenchable fluorescing agents, that are
CC   different. The sequence presented is the hairpin oligonucleotide target
CC   sequence, #1, used in an example of the invention.

PT Annealing control primer to improve annealing specificity in nucleic acid
PT amplification, has region complementary to target, arbitrary nucleotide
PT sequence, regulator with universal base/non-discriminatory base analog.
XX
PS Example 2; SEQ ID NO 54; 190pp; English.
XX
CC The present invention describes an annealing control primer (ACP) (I) for
CC improving the annealing specificity in nucleic acid amplification. (I)
CC has a 3'-end portion with a nucleotide sequence complementary to a site
CC on a template nucleic acid for hybridisation, a 5'-end portion having a
CC pre-selected arbitrary nucleotide sequence, and a regulator portion
CC between the 3' and 5'-end portions, comprising a universal or non-
CC discriminatory base analogue, where the regulator portion is capable of
CC regulating an annealing portion of the primer in association with
CC annealing temperature. (I) is useful for improving annealing specificity
CC in nucleic acid amplification. (I) is useful for amplifying a nucleic
CC acid sequence from a DNA or a mixture of nucleic acids, for selectively
CC amplifying a target nucleic acid sequence from a DNA, and for selectively
CC amplifying a target nucleic acid sequence from a mRNA, by reverse
CC transcribing the mRNA and performing an amplification reaction using (I).
CC (I) is also useful for detecting DNA complementary to differentially
CC expressed mRNA in two or more nucleic acid samples, by reverse
CC transcribing the mRNA and performing an amplification reaction using (I).
CC (I) is also useful for rapidly amplifying a target cDNA fragment
CC comprising a cDNA region corresponding to the 3'-end or 5'-end region of
CC an mRNA, for amplifying a population of full-length double-stranded cDNAs
CC complementary to mRNAs, and amplifying 5'-enriched double-stranded cDNAs
CC complementary to mRNA. (I) is also useful for amplifying more than one
CC target nucleotide sequence simultaneously using more than one pair of
CC primers in the same reaction, where the primers are derived from (I), for
CC producing a DNA fingerprint of genomic DNA (gDNA), for producing a RNA
CC fingerprint of an mRNA sample, identifying conserved homology segments in
CC a multigene family from an mRNA sample, and for identifying conserved
CC homology segments in a multigene family from gDNA. (I) is also useful for
CC identifying a nucleotide variation in a target nucleic acid, and for
CC mutagenesis in a target nucleic acid. The present sequence represents a
CC primer which is used in the exemplification of the present invention.

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 3; Page 30; 62pp; English.
XX
CC   The present sequence is that of a perfectly matched target sequence for a
CC   molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC   covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC   a nanoparticle. In the native state, the probe forms a hairpin
CC   conformation with hybridised termini. The proximity of the fluorophore
CC   and quencher (gold nanoparticle) in the molecular beacon results in
CC   little or no detectable fluorescence. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, such as the
CC   present sequence, the hairpin undergoes a conformational change resulting
CC   in an increase in fluorescence, the extent of which is proportional to
CC   the amount of target sequence present. Single mismatches can be detected.
CC   The invention relates generally to the use of metal surface quenchers
CC   such as particles or films for high sensitivity applications in, for
CC   example, detection and diagnostic systems

PT   Methods and polynucleotide(s) for diagnosing hyperhomocysteinaemia -
PT   and/or predisposition to develop premature atherosclerosis by detecting
PT   increased levels of serum homocysteine.
XX
PS   Disclosure; Page 22; 84pp; English.
XX
CC   Arbitrary RT-PCR primers (AAT75138-42) were used to amplify mRNA from
CC   cells exposed to hyperphysiological, normal or subphysiological levels of
CC   homocysteine. PCR products were separated on a sequencing gel and
CC   discrete fractions which were increased or decreased were identified.
CC   This method was used to identify mRNA and the corresponding cDNA which
CC   are increased in the cells of a patient having hyperhomocysteinaemia or a
CC   predisposition to homocysteine mediated atherosclerosis. These
CC   polynucleotides can be used for the diagnosis and treatment of
CC   atherosclerotic diseases and diseases of metabolism of sulphur containing
CC   amino acids (e.g. homocysteinaemia), which are associated with vascular
CC   damage and atherosclerotic disease, specifically unstable angina, acute
CC   myocardial infarction (heart attack), cerebrovascular accidents (stroke),
CC   hypertension, renal artery stenosis, aortic stenosis and deep vein
CC   occlusive disease

PT   Novel antibody to ST2L, an epitope found on the extracellular surfaces of
PT   T helper 1 cells.
XX
PS   Disclosure; Page 12; 44pp; English.
XX
CC   The invention provides an antibody specific for epitopes (AAY27164-175)
CC   located on the extracellular domain of ST2L protein. The antibody is
CC   used: (a) in a binding assay to identify and/or distinguish T-helper 1
CC   (Th1) or Th2 and evaluate the abundance of Th2 in a sample of body fluid
CC   or tissue; (b) to lyse Th2 cells in preference to Th1 cells or otherwise
CC   inhibit Th2 cell function; and (c) as a medicament for use in therapy as
CC   a mediator of an allergic reaction, e.g. asthma; diseases mediated by
CC   intracellular pathogens, especially Leishmania, or against an
CC   inflammatory disease, especially arthritis. The antibody is targeted to
CC   an epitope (ST2L) which is a member of the immunoglobulin superfamily and
CC   is found on Th2 cells and not Th1 cells

PT   New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT   vasoconstriction.
XX
PS   Disclosure; Page 70; 120pp; English.
XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   Newly isolated nucleic acid molecule (designated p23) encoding a p23
PT   polypeptide - useful for inducing a senescence phenotype in a cell.
XX
PS   Example 1; Page 18; 44pp; English.
XX
CC   The present invention describes human senescence factor p23. An
CC   expression vector for p23 is useful for inducing a senescent phenotype in
CC   a cell (preferably eukaryotic). This may help in regulating diseases,
CC   including cancer, persistent inflammation, and various proliferative and
CC   degenerative disorders. These transgenic cells are useful in gene therapy
CC   for treating cancer, particularly where antisense oligonucleotides are
CC   useful for blocking normal or mutant p23 expression in cancer cells or
CC   other proliferating cells. Transgenic cells are also useful for producing
CC   the p23 polypeptide in large quantities. The antibodies are useful for
CC   raising antiserum against p23, and for identifying senescent cells in
CC   culture and tissue biopsies. The p23 polynucleotides are useful for
CC   modulating or altering p23 activity in a cell, and for identifying and
CC   isolating the whole gene encoding p23, and variants of p23. Assays based
CC   on p23 elements, which detect p23 levels and activity are useful as
CC   diagnostic markers for staging tumours, determining prognosis, and/or
CC   predicting therapeutic success. These elements also provide an assay for
CC   detecting chromosomal rearrangements in chromosome 3 in a human cell. The
CC   isolation of the p23 polynucleotide permits the manipulation of malignant
CC   growth in cancer. The present sequence represents a primer used in an
CC   example from the present invention

XX
CC This sequence represents a primer of the invention. The invention relates
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC natural number indicating the repetition of alpha; beta, delta = V or N;
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC repetition of gamma, in which thymine expressed by gamma is composed of
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC useful as primers for RT-PCR and determination of base sequences. The new
CC sequences allow for reproductive and highly efficient analysis of gene
CC sequences

PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
PS Disclosure; Page 539; 1343pp; English.
XX
CC The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to

```
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   A method for sensitivity test to anti-cancer agents.
XX
PS   Example 1; Page 3; 7pp; Japanese.
XX
CC   The invention relates to a novel method for testing the sensitivity of
CC   cancer cells to anti-cancer agents. The method comprises quantitative
CC   detection of a mitochondria-localised heat shock protein 75 (mtHSP75)
CC   gene (mtHSP75 cDNA given in AAA97560). Cancer cells expressing high
CC   levels of mtHSP75 are more likely to be resistant to anti-cancer agents,
CC   while those expressing low levels are more likely to be susceptible to
CC   such agents. The invention also relates to the use of RNA complementary
CC   to mtHSP75 or an mtHSP75 gene fragment in the method of the invention,
CC   the use of Northern blotting to detect mtHSP75 RNA, and the use of
CC   Western blotting to detect the mtHSP75 gene product. The method of the
CC   invention may particularly be used to test the sensitivity of cancer
CC   cells to platinum complex compounds, especially cisplatin. The invention
CC   provides for the selection of anti-cancer agents likely to be effective
CC   against a tumour in a particular individual. The present sequence
CC   represents a reverse transcription primer used to generate human mtHSP75
CC   cDNA in an exemplification of the invention

PT   Screening for a test compound that binds to an estrogen receptor in a
PT   receptor binding assay comprising detecting estrogen receptor polypeptide
PT   mediated transcription.
XX
PS   Example 3; Page 28; 77pp; English.
XX
CC   The present invention describes a method for screening a test compound
CC   that binds to an ER (oestrogen receptor) in a receptor binding assay. The
CC   method comprises: (a) providing a cell which comprises at least one
CC   oestrogen-regulated DNA sequence encoding MT-II (metallothionein) and at
CC   least one DNA sequence encoding ER-beta polypeptide; (b) contacting the
CC   cell with either the test compound; and (c) detecting the expression of
CC   the MT-II. The method is useful for screening a test compound that binds
CC   to an ER in a receptor binding assay by detecting (the inhibition of) ER-
CC   beta polypeptide mediated transcription and identifying drug candidates
CC   which mimic or inhibit oestrogen's effects on ER-beta or ER-alpha
CC   mediated transcription. The screening method is also useful for
CC   identifying tissue specific oestrogens. The method is adapted to a high
CC   throughput screen, allowing multiplicity of compounds to be tested in a
CC   single assay. The ER-beta binding assays are advantageous in
CC   accommodating many different types of solvents and therefore allowing the
CC   testing of compounds from many sources. The present sequence represents
CC   an oligonucleotide which is used in an example from the present
CC   invention, for RADE (rapid analysis of differential expression)

PT Novel learning induced kinase polynucleotides and polypeptides, useful
PT for the analysis of learning and memory, and for gene therapy.
XX
PS Example 2; Page 4; 64pp; English.
XX
CC The present sequence represents a differential display PCR primer used in
CC the isolated of a learning-induced kinase, designated KKIAMRE kinase,
CC from rabbit brain tissue in an example from the present invention.
CC KKIAMRE kinase is a cdc2-related kinase. The KKIAMRE kinase
CC polynucleotides can be used to express recombinant protein for analysis,
CC characterisation or therapeutic use, as markers for tissues in which the
CC protein is preferentially expressed, as molecular weight markers on
CC Southern gels, as chromosome markers or tags, to compare endogenous DNA
CC sequences in patients to identify potential genetic disorders, as probes
CC to hybridise and discover novel related sequences, as a source of PCR
CC primers, and as an antigen to induce anti-DNA antibodies. The
CC polypeptides can be used in assay to discover biological activity, to
CC raise antibodies, as tissue markers, and to isolate correlative receptors
CC or ligands. The polynucleotides may also be used for gene therapy for the
CC treatment of disorders which are mediated by KKIAMRE kinase

PT Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 264; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC fragments and antisense oligonucleotides used in the exemplification of
CC the present invention

PT Evaluating a cellular response to an environmental compound, for use in
PT toxicological analysis, involves determining or comparing the expression
PT levels of at least one endogenous gene.
XX
PS Example 3; Page 27; 77pp; English.
XX
CC The sequence represents a downstream PCR primer used in a DDRT-PCR
CC experiment (and in cDNA synthesis), demonstrating the method of the
CC invention. The method relates to evaluating a cellular response to an
CC environmental compound, comprising determining or comparing the
CC expression levels of at least one endogenous gene e.g by differential
CC display of reverse transcribed mRNAs by PCR (DDRT-PCR). The method can be
CC adapted to identify compounds that act on the level of endogenous gene
CC expression through activating nuclear receptors. The method is useful in
CC toxicological analysis, diagnostics, for diagnosing cancer (e.g.
CC testicular, breast, prostate and endometrium), asthma, hypospadia,
CC cryptorchism and/or allergy, and for evaluating the efficiency of a
CC treatment for hormonal deficiency or hormonal replacement therapy, in a
CC human such as a post-menopausal female. The method is also useful for
CC identifying environmental chemicals or pharmaceutical compositions that
CC interact with endocrine systems, and for detecting chemicals that pose a
CC health threat. Expression levels of endogenous genes are determined
CC rapidly using a sensitive technique, and the expression of any gene can
CC be monitored. The assays are far more informative than the currently used
CC assays, and significantly reduces the number of animals required for the
CC testing, as it is expected that essentially all the animals in a test
CC group will respond to the compound

PT Expression cassette comprises promoters with basal promoter activity
PT operably linked to a heterologous polynucleotide, useful for expression
PT genes in suspensor cells in plants and/or basal region of plant embryo.
XX
PS Example; Page 54; 114pp; English.
XX
CC The present invention relates to expression cassettes comprising a
CC promoter sequence and a promoter polynucleotide with basal promoter
CC activity, where the promoter sequence is operably linked to a
CC heterologous polynucleotide, and when the expression cassette is inserted
CC into a plant, the heterologous polynucleotide is specifically expressed
CC in a suspensor cell and/or basal region of a plant embryo. The invention
CC also provides polynucleotide sequences encoding Scarlet runner bean
CC (Phaseolus coccineus) G564 and C541 proteins for use in the expression
CC cassettes of the invention. The expression cassettes comprising promoters
CC and promoter control elements are useful for modulating transcription of
CC genes in a plant suspensor cell and/or basal region of a plant embryo.
CC The present sequence represents an anchor/reverse reverse transcriptase
CC (RT)-PCR primer used in the examples of the present invention

PT   New isolated polynucleotide encoding E4 gene involved in insulin
PT   resistance syndrome, useful for identifying chemical compound useful for
PT   controlling e.g. non-insulin dependent diabetes mellitus.
XX
PS   Example 3; Page 19; 46pp; English.
XX
CC   The invention relates to an isolated polynucleotide (I) molecule
CC   comprising a nucleotide sequence which encodes an E4 polypeptide (II) or
CC   its fragment of at least 10 amino acids. (II) is useful for identifying a
CC   chemical compound capable of modulating the activity of E4 by contacting
CC   the chemical compound with (II) or a transgenic non-human mammal and
CC   measuring any effect of chemical compound on the activity of (II) or
CC   transgenic non-human mammal, where the identifying method is useful for
CC   making a pharmaceutical composition, which comprises mixing the compound
CC   thus identified with a carrier, and the compound is preferably an
CC   antibody that is useful for controlling insulin resistance syndrome and
CC   other related disorders such as non-insulin dependent diabetes mellitus
CC   (NIDDM), dyslipidaemia, obesity, and atherosclerosis. The present
CC   sequence represents a PCR primer used to isolate the coding sequence of
CC   mouse E4 protein

PT   New isolated polynucleotide encoding E4 gene involved in insulin
PT   resistance syndrome, useful for identifying chemical compound useful for
PT   controlling e.g. non-insulin dependent diabetes mellitus.
XX
PS   Example 3; Page 19; 46pp; English.
XX
CC   The invention relates to an isolated polynucleotide (I) molecule
CC   comprising a nucleotide sequence which encodes an E4 polypeptide (II) or
CC   its fragment of at least 10 amino acids. (II) is useful for identifying a
CC   chemical compound capable of modulating the activity of E4 by contacting
CC   the chemical compound with (II) or a transgenic non-human mammal and
CC   measuring any effect of chemical compound on the activity of (II) or
CC   transgenic non-human mammal, where the identifying method is useful for
CC   making a pharmaceutical composition, which comprises mixing the compound
CC   thus identified with a carrier, and the compound is preferably an
CC   antibody that is useful for controlling insulin resistance syndrome and
CC   other related disorders such as non-insulin dependent diabetes mellitus
CC   (NIDDM), dyslipidaemia, obesity, and atherosclerosis. The present
CC   sequence represents a PCR primer used to isolate the coding sequence of
CC   mouse E4 protein

PT   Novel human cervical cancer 2 protooncogene protein and polynucleotide
PT   encoding it useful for diagnosing various cancers e.g. leukemia, lymphoma
PT   or uterine cervix cancer, and for producing transformed animals.
XX
PS   Disclosure; Page 47; 49pp; English.
XX
CC   The invention discloses a human cervical cancer 2 (HCCR-2) protooncogene
CC   and encoded protein. The protooncogene was discovered using mRNA
CC   differential display, identifying it as being amplified in cancer cells
CC   and, more specifically, involved in the tumourigenesis of cervical
CC   cancer. HCCR-2 is useful for preventing, diagnosing or treating cancer,
CC   including leukaemia, lymphoma, colon, breast, kidney, stomach, lung,
CC   ovary or uterine cervix cancer. HCCR-2 is also useful for producing
CC   antibodies which are useful as diagnostic tools. HCCR-2 protooncogene is
CC   useful in the diagnosis of various cancers, in antisense gene therapy and
CC   for producing transformed animals which are useful in screening for
CC   carcinogens or anticancer agents, such as antioxidants. The protooncogene
CC   is also useful for establishing a continuous viable cancer cell line
CC   which is useful in searching for anticancer agents. The sequence
CC   presented is the anchored oligo-dT primer, H-T11A, which was used to
CC   amplify cDNA for differential display. This technique identified a cDNA
CC   fragment, designated CC214, which was then used as a probe to isolate the
CC   full length cDNA (cervical cancer 2 (HCCR-2) protooncogene) from a human
CC   lung embryonic fibroblast cDNA library

```

```
CC   The invention relates to a method of modulating angiogenesis in a tissue
CC   comprising mammalian cells by modulating pituitary tumour transforming
CC   gene (PTTG) expression and/or endogenous PTTG1 protein function in at
CC   least one of the cells. The method is useful for enhancing or inhibiting
CC   angiogenesis. Specifically, enhancing wound healing and/or tissue
CC   regeneration and limiting scar formation. The method is also useful in
CC   treating malignant tumours and retinopathy. The present sequence is a PCR
CC   primer used for isolating PTTG1 cDNA

PT   Inhibiting neoplastic cellular proliferation and/or transformation of a
PT   mammalian cell, by using Pituitary tumor transforming gene carboxy-
PT   terminal peptides.
XX
PS   Example 1; Page 64; 190pp; English.
XX
CC   The patent discloses pituitary tumour transforming gene (PTTG) carboxy
CC   terminal peptides. The invention also relates to methods for inhibiting
CC   neoplastic cellular proliferation and transformation (NP/T) of mammalian
CC   cells. The method involves delivering a composition comprising a PTTG
CC   carboxy-terminal-related polynucleotide, an expression vector comprising
CC   a polynucleotide encoding PTTG C-terminal (PTTG-C) peptide, PTTG-C
CC   peptide to a mammalian cell that overexpresses PTTG. The compositions
CC   comprising PTTG-C peptides are useful for inhibiting neoplastic cellular
CC   proliferation and/or transformation of a mammalian cell. PTTG-C peptides
CC   are useful in bioassays, as immunogens to produce anti-PTTG-C antibodies
CC   and in therapeutic compositions. PTTG antibodies are also useful for
CC   inhibiting the activation of mammalian T-lymphocytes. Sequences of the
CC   invention are used as vaccines and in gene therapy. The present sequence
CC   is a PCR primer which is used for amplifying rat PTTG1 cDNA

CC   The present invention describes DNA sequences relating to anti-cancer
CC   drug resistance. The DNA sequences can be used as a component of a kit or
CC   a DNA chip for detecting the presence of anti-cancer resistance. The
CC   method for identifying and sequencing the DNA sequences comprises
CC   obtaining an anti-cancer sensitive cancer tissue and an anti-cancer drug
CC   resistant cancer tissue from patients suffering from lung cancer and head
CC   and neck cancer, isolating mRNAs from the tissues, preparing cDNAs of the
CC   tissues from mRNAs using reverse transcriptase; finding genes showing the
CC   increase or decrease of gene expression in the cancer tissues before and
CC   after the anti-cancer drug treatment using differential display of
CC   polymerase chain reaction (PCR), subjecting the genes to electrophoresis,
CC   amplifying the cDNAs by using PCR, sub-cloning the amplified cDNAs into
CC   pGEM-Teasy plasmid, and sequencing the cDNA using an auto-sequencing
CC   machine. The present sequence represents an oligonucleotide which is used
CC   in the exemplification of the present invention

PT Novel method of inhibiting neoplastic cellular proliferation and/or
PT transformation of a mammalian cell used for treating e.g. malignant
PT tumours.
XX
PS Example 1; Page 60; 175pp; English.
XX
CC The present invention describes a method for inhibiting neoplastic
CC cellular proliferation and/or transformation of a mammalian cell. The
CC method comprises delivering to a mammalian cell that endogenously over
CC expresses pituitary tumour transforming gene (PTTG1), a composition
CC comprising, an expression vector comprising a promoter and a
CC polynucleotide, where the polynucleotide comprises a first DNA segment
CC encoding a mammalian PTTG2 peptide the polynucleotide being operatively
CC linked to the promoter in a transcriptional unit, where PTTG2 is selected
CC from: (a) a peptide (I) consisting essentially of a 191 amino acid
CC sequence (see ABB79058) or a functional fragment comprising at least
CC amino acid residues 1-180; or (b) a mammalian PTTG2 peptide having at
CC least 95% sequence homology with (I). The expression vector is complexed
CC with a cellular uptake-enhancing agent such that the PTTG2 peptide is
CC expressed in the cell where neoplastic cellular proliferation and/or
CC transformation of the cell is inhibited. PTTG2 protein regulates
CC transactivating activity by PTTG1 and that PTTG2 peptide molecules have
CC the ability to down regulate PTTG1 gene expression and/or PTTG1 protein
CC function in a negative manner. The method is useful in inhibiting
CC neoplastic cellular proliferation and/or transformation of mammalian
CC cells both in vivo and in vitro. The method is also useful in treating
CC malignant tumours. The present sequence represents an anchor primer used
CC in the isolation of PTTG cDNA, which is used in an example from the
CC present invention

PT Inhibiting the activation of a mammalian T-lymphocyte cell useful for
PT treating immune-related disorders by inhibiting PTTG1 gene expression.
XX
PS Example 21; Page 112; 185pp; English.
XX
CC The invention relates to inhibiting the activation of a mammalian T-
CC lymphocyte cell comprising inhibiting pituitary tumour transforming gene
CC (PTTG1) expression and/or endogenous PTTG1 protein function in the T-
CC lymphocyte cell, whereby activation of the T-lymphocyte cell is
CC inhibited. PTTG upregulates bFGF secretion and transactivates DNA
CC transcription. Compositions and methods of the invention are useful for
CC inhibiting neoplastic and non-neoplastic proliferation of mammalian T-
CC lymphocyte cells, including activated normal lymphocytes and transformed
CC lymphocytes. The compositions and methods are useful in the prevention or
CC inhibition of xenograft or allograft rejection and in the treatment of
CC allergic, asthmatic and/or autoimmune conditions such as systemic lupus
CC erythematosus (SLE), autoimmune myasthenia gravis, rheumatoid arthritis,
CC autoimmune encephalomyelitis, psoriasis, atherosclerosis and other
CC autoimmune diseases. The inventive methods and compositions are also
CC useful in the treatment of T-cell neoplasias, such as leukaemia, or any
CC haematologic or lymphopoietic neoplasm e.g. Hodgkin's disease. The
CC present sequence is that of a PTTG encoding polynucleotide sequence

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 11560; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT   New human cervical cancer suppressor gene (HCCS-5), useful for inducing
PT   apoptosis or suppressing proliferation of cancer cells, particularly for
PT   treating or preventing cancer (e.g. cervical cancer).
XX
PS   Example 1; Page 22; 23pp; English.
XX
CC   The present invention describes human cervical cancer suppressor 5 (HCCS-
CC   5), which is a tumour suppressor. Also described: (1) the HCCS-5 protein
CC   having 111 amino acids; (2) an expression vector comprising the HCCS-5
CC   gene or its fragment; (3) a microorganism cell or an animal cell
CC   transformed with the expression vector; (4) suppressing proliferation of
CC   cancer cells by introducing the expression vector into a cancer cell to
CC   induce its apoptosis; and (5) a composition for preventing or treating
CC   cancer comprising the HSSC-5 gene or its fragment, and a pharmaceutical
CC   carrier. HSSC-5 has cytostatic activity, and can be used for gene
CC   therapy. The HSSC-5 gene or the vector can be used for inducing apoptosis
CC   or suppressing proliferation of cancer cells, particularly for treating
CC   or preventing cancer (e.g. cervical cancer). The present sequence
CC   represents an H-T11A anchored oligo-dT primer, which was used in an
CC   example from the present invention

PT   New human cervical cancer proto-oncogene, useful for preparing a
PT   composition for preventing or treating cancer.
XX
PS   Example 2; Page 27; 28pp; English.
XX
CC   The present invention describes a human cervical cancer proto-oncogene 7
CC   (HCC-7 proto-oncogene). HCC-7 proto-oncogene is located on human
CC   chromosome 5. HCC-7 proto-oncogene has cytostatic activity and can be
CC   used in vaccines and gene therapy. HCC-7 proto-oncogene can be used for
CC   preparing a composition for preventing or treating cancer. The HCC-7
CC   protein expressed from the proto-oncogene is useful for producing an
CC   antibody for diagnosing cancer. The present sequence represents a PCR
CC   primer which is used in an example from the present invention

PS   Example 17; Page 148; 240pp; English.
XX
CC   The invention relates to a novel method of inhibiting the expression of
CC   one or more genes or RNA transcripts by administering at least one
CC   oligonucleotide analogue that includes at least one hydroxyproline
CC   nucleic acid (HypNA) monomer to a cell or organism or their extracts. Thr
CC   oligonucleotides of the invention may be used to monitor properties
CC   including gene expression, respiration, secretion, signalling, ion-
CC   channel activity, cell motility, developmental phenotype and tumour
CC   regression. Furthermore, they may be utilised to determine the effects of
CC   particular genes, as antisense or homologous recombination constructs
CC   e.g. for creating animal models of disease and finally, for increasing
CC   the activity of some enzymes, such as polymerases. The current sequence
CC   is that of the PNA-HypNA hybridisation oligomer of the invention. This
CC   sequence may also comprise phosphono-PNA (pPNA) and serine nucleic acid
CC   (SerNA) components.

PT   Diagnosing and treating Noonan syndrome in a subject using a mutation in
PT   a protein tyrosine phosphatase 11 gene with increased expression or
```

```
PT   activity.
XX
PS   Example 4; SEQ ID NO 34; 262pp; English.
XX
CC   The present invention describes a method for diagnosing Noonan syndrome
CC   in a subject. The method comprises detecting a mutation in the protein
CC   tyrosine phosphatase 11 (PTPN11) gene in a subject, where the mutation
CC   results in increased PTPN11 expression or activity as compared to
CC   control. The human PTPN11 gene is located on chromosome 12, more
CC   specifically to 12q24. Also described: (1) a kit for diagnosing Noonan
CC   syndrome, comprising an oligonucleotide that specifically hybridises to
CC   or adjacent to a site of mutation of a PTPN11 gene that results in
CC   increased activity of a PTPN11 protein encoded by the gene or an antibody
CC   that specifically recognises a mutation in a PTPN11 protein, and
CC   instructions for use; (2) diagnosing Noonan syndrome in a subject,
CC   comprising assessing the level of expression or activity of a PTPN11
CC   protein in the test subject, and comparing it to the level of expression
CC   or activity in a control subject, where an increased expression or basal
CC   activity of the PTPN11 protein in the test subject compared to the
CC   control is indicative of Noonan syndrome; (3) treating Noonan syndrome in
CC   a patient, comprising administering an agent that modulates the
CC   expression or activity of a PTPN11 protein in association with a carrier;
CC   (4) an isolated PTPN11 variant comprising a mutation resulting in
CC   increased level of PTPN11 activity; (5) an isolated cell comprising a
CC   vector comprising a nucleic acid encoding the PTPN11 variant of (4),
CC   operatively associated with an expression control sequence; (6) an
CC   isolated nucleic acid encoding the PTPN11 variant of (4); and (7) an
CC   isolated oligonucleotide which specifically hybridises to the nucleic
CC   acid of (6). The methods and compositions of the present invention are
CC   useful for diagnosing and treating a disorder associated with the
CC   aberrant expression and/or activity of the PTPN11 gene, specifically
CC   Noonan syndrome. The present sequence represents a PCR primer used in the
CC   amplification of human PTPN11, which is given in the exemplification of
CC   the present invention.

PT   Measuring expression of low abundance reduced complexity target nucleic
PT   acid molecules.
XX
PS   Example 3; Page 91; 187pp; English.
XX
CC   AAZ36739-41 represent oligo(dT) primers used for modified differential
CC   display, in the method of the invention. The specification describes a
CC   method for measuring the level of two or more nucleic acid molecules in a
CC   target. The method comprises contacting a probe with an arbitrarily or
CC   statistically sampled target and detecting the amount of specific binding
CC   of the target to the probe. The methods can be used to identify
CC   differentially expressed nucleic acid molecules associated with disease
CC   states, such as cancer, autoimmune disease, infectious disease, aging,
CC   developmental disorder, proliferative disorder or neurological disorder.
CC   Alternatively the methods can be used to assess the efficacy or toxicity
CC   of or a resistance to a treatment. Also the methods can be used to
CC   determine differential expression of nucleic acid molecules in response
CC   to a stimulus, e.g. a chemical, drug or growth factor (especially
CC   epidermal growth factor), radiation, stress or a pathogen. The methods
CC   can also be used to determine co-regulated genes that can be potential
CC   targets for drug discovery

XX
CC   The invention relates to the human pollinosis-associated gene 373 which
CC   exhibits significantly reduced expression in the T-cells of individuals
CC   with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC   was isolated from T-cells from individuals allergic to cedar pollen using
CC   the differential display method. The invention also relates also relates
CC   to the protein encoded by pollinosis gene 373; expression constructs and
CC   host cells comprising pollinosis-associated gene 373 nucleic acids;
CC   pollinosis-associated gene 373 primers and probes; antibodies against the
CC   protein encoded by the gene; methods of detection of pollinosis-
CC   associated gene 373 nucleic acids; and a method of diagnosis of allergic
CC   diseases via the detection of pollinosis-associated gene 373 nucleic
CC   acids. The invention additionally encompasses methods of screening drug
CC   candidates for the treatment of allergic disease by measuring the
CC   expression of pollinosis-associated gene 373 in pollen antigen-stimulated
CC   T-cells in the presence of a test compound relative to a control.
CC   Pollinosis-associated gene 373 is useful in the diagnosis of allergic
CC   diseases and in the screening of drug candidates for the treatment of
CC   such diseases. The present sequence represents a PCR primer used in the
CC   isolation of human pollinosis-associated gene 373 cDNA

CC   The invention relates to the human pollinosis-associated gene 627 which
CC   exhibits significantly reduced expression in the T-cells of individuals
CC   with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC   was isolated from T-cells from individuals allergic to cedar pollen using
CC   the differential display method. The invention also relates to methods of
CC   detection of pollinosis-associated gene 627 nucleic acids; a method of
CC   diagnosis of allergic diseases via the detection of pollinosis-associated
CC   gene 627 nucleic acids; and a method of screening drug candidates for the
CC   treatment of allergic disease by measuring the expression of pollinosis-
CC   associated gene 627 in pollen antigen-stimulated T-cells in the presence
CC   of a test compound relative to a control. Pollinosis-associated gene 627
CC   is useful in the diagnosis of allergic diseases and in the screening of
CC   drug candidates for the treatment of such diseases. The present sequence
CC   represents a PCR primer used in the isolation of human pollinosis-
CC   associated gene 627 cDNA

PS   Example 6; Page 35; 42pp; Japanese.
XX
CC   This invention describes a novel nucleic acid molecule comprising a
CC   sequence (I) which undergoes significantly low expression in subjects
CC   after pollen scattering, and is useful in diagnosis of allergic diseases
CC   and screening candidate compounds for remedies capable of regulating the
CC   response of T cells to the stimulus by an antigen

XX
CC The invention relates to a method for examining allergic diseases
CC comprises determining the expression level of a gene containing, the
CC human cDNA appearing as ABK49633 which has homology with
CC acetyltransferases in the eosinophils of a patient and comparing the
CC expression level with that in the eosinophils of a healthy individual
CC (i.e. differential display). Also included are methods of screening for
CC candidate compounds which affect the expression level of the gene or the
CC activity of the protein encoded by the gene (including related proteins
CC and mutants), the use of probes based on the gene sequence in the
CC examination of allergic diseases, the use of reporter constructs in the
CC screening of candidate compounds, a vector containing a the transcription
CC -controlling region of the gene, cells transformed with the vector, an
CC antibody against the protein and a model animal for allergic diseases
CC which is a transgenic non-human vertebrate with lowering of expression
CC intensity of the gene in eosinophils. The method is examining allergic
CC diseases particularly atopic dermatitis which is also applicable in
CC screening candidate compounds for remedies. Such method can be performed
CC in high throughput, at low cost. The present sequence is a differential
CC display PCR primer for the cDNA encoding the human acetyltransferase-like
CC protein 20-90-05

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 483; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
```

```
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

XX
PT Examining allergic diseases, such as atopic dermatitis, comprises
PT comparing the expression levels of gene B1799 in T cells in a patient and
PT a healthy individual.
XX
PS Example 1; SEQ ID NO 5; 87pp; Japanese.
XX
CC This invention relates to a novel method for screening and examining
CC allergic diseases by the use of B1799 as the indicator gene.
CC Specifically, it comprises determining the expression level of this
CC indicator gene in a biological sample obtained from the patient, and
CC identifying differential expression (increased expression of B1799) in
CC comparison to that observed in a healthy individual. The present
CC invention describes the B1799 protein as antiallergic, antiinflammatory
CC and dermatological. As such, through the use of gene therapy, this method
CC can be used to treat allergic diseases particularly atopic dermatitis.
CC Furthermore, it is useful for determining a diagnosis that is convenient
CC and non-invasive, and is also applicable in high throughput screening to
CC identify candidate compounds for additional remedies. This
CC oligonucleotide sequence is the DNA oligo (SeqID 5) related to the human
CC B1799 gene of the invention.

PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
PS Claim 4; Page 68; 218pp; English.
XX
CC The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples

PT   New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT   vasoconstriction.
XX
PS   Disclosure; Page 70; 120pp; English.
XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT New antisense oligonucleotides useful for treating e.g. pulmonary
PT vasoconstruction, inflammation, allergies, asthma, hypertension,
PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
PS Disclosure; Page 539; 1343pp; English.
XX
CC The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

```
XX
CC   This invention describes novel DNA sequences preferentially expressed in
CC   IgA nephropathy patients, and DNA sequences stringently hybridizing to
CC   them. Independent claims cover diagnostic reagents for IgA nephropathy
CC   incorporating the antisense sequences; the treatment of IgA nephropathy
CC   using the antisense sequences for mRNA inhibition; proteins associated
CC   with IgA nephropathy, containing sequences encoded by the DNA sequences;
CC   antibodies recognizing these proteins; the production of the proteins by
CC   culture of host cells transformed with DNA encoding them; diagnostic
CC   reagents for IgA nephropathy containing the antibodies; and compositions
CC   for the treatment of IgA nephropathy which contain the antibodies. The
CC   products of the invention can be used for the diagnosis and treatment of
CC   IgA nephropathy. This sequence represents a primer used in the isolation
CC   and identification of the human IgA nephropathy-associated proteins

PT   DNA sequences preferentially expressed in IgA nephropathy patients,
PT   proteins encoded by them, and antibodies to those proteins.
XX
PS   Claim 3; Page 170; 180pp; Japanese.
XX
CC   This invention describes novel DNA sequences preferentially expressed in
CC   IgA nephropathy patients, and DNA sequences stringently hybridizing to
CC   them. Independent claims cover diagnostic reagents for IgA nephropathy
CC   incorporating the antisense sequences; the treatment of IgA nephropathy
CC   using the antisense sequences for mRNA inhibition; proteins associated
CC   with IgA nephropathy, containing sequences encoded by the DNA sequences;
CC   antibodies recognizing these proteins; the production of the proteins by
CC   culture of host cells transformed with DNA encoding them; diagnostic
CC   reagents for IgA nephropathy containing the antibodies; and compositions
CC   for the treatment of IgA nephropathy which contain the antibodies. The
CC   products of the invention can be used for the diagnosis and treatment of
CC   IgA nephropathy. This sequence represents a primer used in the isolation
CC   and identification of the human IgA nephropathy-associated proteins

CC   AAZ36739-41 represent oligo(dT) primers used for modified differential
CC   display, in the method of the invention. The specification describes a
CC   method for measuring the level of two or more nucleic acid molecules in a
CC   target. The method comprises contacting a probe with an arbitrarily or
CC   statistically sampled target and detecting the amount of specific binding
CC   of the target to the probe. The methods can be used to identify
CC   differentially expressed nucleic acid molecules associated with disease
CC   states, such as cancer, autoimmune disease, infectious disease, aging,
CC   developmental disorder, proliferative disorder or neurological disorder.
CC   Alternatively the methods can be used to assess the efficacy or toxicity
CC   of or a resistance to a treatment. Also the methods can be used to
CC   determine differential expression of nucleic acid molecules in response
CC   to a stimulus, e.g. a chemical, drug or growth factor (especially
CC   epidermal growth factor), radiation, stress or a pathogen. The methods
CC   can also be used to determine co-regulated genes that can be potential
CC   targets for drug discovery

PT Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 264; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary

```

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and

PS   Example 6; Page 70; 80pp; Japanese.
XX
CC   The invention relates to the human pollinosis-associated gene 373 which
CC   exhibits significantly reduced expression in the T-cells of individuals
CC   with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC   was isolated from T-cells from individuals allergic to cedar pollen using
CC   the differential display method. The invention also relates also relates
CC   to the protein encoded by pollinosis gene 373; expression constructs and
CC   host cells comprising pollinosis-associated gene 373 nucleic acids;
CC   pollinosis-associated gene 373 primers and probes; antibodies against the
CC   protein encoded by the gene; methods of detection of pollinosis-
CC   associated gene 373 nucleic acids; and a method of diagnosis of allergic
CC   diseases via the detection of pollinosis-associated gene 373 nucleic
CC   acids. The invention additionally encompasses methods of screening drug
CC   candidates for the treatment of allergic disease by measuring the
CC   expression of pollinosis-associated gene 373 in pollen antigen-stimulated
CC   T-cells in the presence of a test compound relative to a control.
CC   Pollinosis-associated gene 373 is useful in the diagnosis of allergic
CC   diseases and in the screening of drug candidates for the treatment of
CC   such diseases. The present sequence represents a PCR primer used in the
CC   isolation of human pollinosis-associated gene 373 cDNA

CC   to the protein encoded by pollinosis gene 373; expression constructs and
CC   host cells comprising pollinosis-associated gene 373 nucleic acids;
CC   pollinosis-associated gene 373 primers and probes; antibodies against the
CC   protein encoded by the gene; methods of detection of pollinosis-
CC   associated gene 373 nucleic acids; and a method of diagnosis of allergic
CC   diseases via the detection of pollinosis-associated gene 373 nucleic
CC   acids. The invention additionally encompasses methods of screening drug
CC   candidates for the treatment of allergic disease by measuring the
CC   expression of pollinosis-associated gene 373 in pollen antigen-stimulated
CC   T-cells in the presence of a test compound relative to a control.
CC   Pollinosis-associated gene 373 is useful in the diagnosis of allergic
CC   diseases and in the screening of drug candidates for the treatment of
CC   such diseases. The present sequence represents a PCR primer used in the
CC   isolation of human pollinosis-associated gene 373 cDNA

PT Pollinosis-associated gene 795 undergoing significantly low expression in
PT subjects with high cedar pollen-specific IgE levels, useful in diagnosis
PT of allergic diseases and screening drug candidates.
XX
PS Page 46; Example 6; 73pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 795 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC was isolated from T-cells from individuals allergic to cedar pollen using
CC the differential display method. Pollinosis-associated gene 795 has
CC homology with the human vimentin gene. The invention also relates also
CC relates to the protein encoded by pollinosis gene 795; to expression
CC constructs and host cells comprising pollinosis-associated gene 795
CC nucleic acids; pollinosis-associated gene 795 primers and probes;
CC antibodies against the protein encoded by the gene; methods of detection

CC of pollinosis-associated gene 795 nucleic acids; and a method of
CC diagnosis of allergic diseases via the detection of pollinosis-associated
CC gene 795 nucleic acids. The invention additionally encompasses methods of
CC screening drug candidates for the treatment of allergic disease by
CC measuring the expression of pollinosis-associated gene 795 in pollen
CC antigen-stimulated T-cells in the presence of a test compound relative to
CC a control. Pollinosis-associated gene 795 is useful in the diagnosis of
CC allergic diseases and in the screening of drug candidates for the
CC treatment of such diseases. The present sequence represents a PCR primer
CC used in the isolation of human pollinosis-associated gene 795 cDNA

PT   Evaluating a cellular response to an environmental compound, for use in
PT   toxicological analysis, involves determining or comparing the expression
PT   levels of at least one endogenous gene.
XX
PS   Example 3; Page 27; 77pp; English.
XX
CC   The sequence represents a downstream PCR primer used in a DDRT-PCR
CC   experiment (and in cDNA synthesis), demonstrating the method of the
CC   invention. The method relates to evaluating a cellular response to an
CC   environmental compound, comprising determining or comparing the
CC   expression levels of at least one endogenous gene e.g by differential
CC   display of reverse transcribed mRNAs by PCR (DDRT-PCR). The method can be
CC   adapted to identify compounds that act on the level of endogenous gene
CC   expression through activating nuclear receptors. The method is useful in
CC   toxicological analysis, diagnostics, for diagnosing cancer (e.g.
CC   testicular, breast, prostate and endometrium), asthma, hypospadia,
CC   cryptorchism and/or allergy, and for evaluating the efficiency of a
CC   treatment for hormonal deficiency or hormonal replacement therapy, in a
CC   human such as a post-menopausal female. The method is also useful for
CC   identifying environmental chemicals or pharmaceutical compositions that
CC   interact with endocrine systems, and for detecting chemicals that pose a
CC   health threat. Expression levels of endogenous genes are determined
CC   rapidly using a sensitive technique, and the expression of any gene can
CC   be monitored. The assays are far more informative than the currently used
CC   assays, and significantly reduces the number of animals required for the
CC   testing, as it is expected that essentially all the animals in a test
CC   group will respond to the compound

PT   diseases and screening candidate compounds to regulate response of T
PT   cells to antigen stimulus.
XX
PS   Example 6; Page 41; 54pp; Japanese.
XX
CC   The invention relates to the human pollinosis-associated gene 787 which
CC   exhibits significantly reduced expression in the T-cells of individuals
CC   after the pollen-scattering season, relative to expression levels in T-
CC   cells before the pollen-scattering season. The gene was isolated from T-
CC   cells from individuals allergic to pollen using the differential display
CC   method. The invention also relates to pollinosis-associated gene 787
CC   primers and probes; methods of detection of pollinosis-associated gene
CC   787 nucleic acids; and a method of diagnosis of allergic diseases via the
CC   detection of pollinosis-associated gene 787 nucleic acids. The invention
CC   additionally encompasses a method of screening drug candidates for the
CC   treatment of allergic disease by measuring the expression of pollinosis-
CC   associated gene 787 in pollen antigen-stimulated T-cells in the presence
CC   of a test compound relative to a control. Pollinosis- associated gene 787
CC   is useful in the diagnosis of allergic diseases and in the screening of
CC   drug candidates for the treatment of such diseases. The present sequence
CC   represents a PCR primer used in the isolation of human pollinosis-
CC   associated gene 787 cDNA

PT Pollinosis-associated gene 787 undergoing significantly low expression in
PT subjects after pollen scattering, useful in diagnosis of allergic
PT diseases and screening candidate compounds to regulate response of T
PT cells to antigen stimulus.
XX
PS Example 6; Page 41; 54pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 787 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC after the pollen-scattering season, relative to expression levels in T-
CC cells before the pollen-scattering season. The gene was isolated from T-
CC cells from individuals allergic to pollen using the differential display
CC method. The invention also relates to pollinosis-associated gene 787
CC primers and probes; methods of detection of pollinosis-associated gene
CC 787 nucleic acids; and a method of diagnosis of allergic diseases via the
CC detection of pollinosis-associated gene 787 nucleic acids. The invention
CC additionally encompasses a method of screening drug candidates for the
CC treatment of allergic disease by measuring the expression of pollinosis-
CC associated gene 787 in pollen antigen-stimulated T-cells in the presence
CC of a test compound relative to a control. Pollinosis- associated gene 787
CC is useful in the diagnosis of allergic diseases and in the screening of
CC drug candidates for the treatment of such diseases. The present sequence
CC represents a PCR primer used in the isolation of human pollinosis-
CC associated gene 787 cDNA

PT different expression particularly increased expression in remission stage
PT in eosinophils of patients, also applicable in screening candidate
PT compounds for remedies.
XX
PS Example 1; Page 57; 72pp; Japanese.
XX
CC The invention relates to a method for examining allergic diseases
CC comprises determining the expression level of a gene containing, the
CC human cDNA appearing as ABK49633 which has homology with
CC acetyltransferases in the eosinophils of a patient and comparing the
CC expression level with that in the eosinophils of a healthy individual
CC (i.e. differential display). Also included are methods of screening for
CC candidate compounds which affect the expression level of the gene or the
CC activity of the protein encoded by the gene (including related proteins
CC and mutants), the use of probes based on the gene sequence in the
CC examination of allergic diseases, the use of reporter constructs in the
CC screening of candidate compounds, a vector containing a the transcription
CC -controlling region of the gene, cells transformed with the vector, an
CC antibody against the protein and a model animal for allergic diseases
CC which is a transgenic non-human vertebrate with lowering of expression
CC intensity of the gene in eosinophils. The method is examining allergic
CC diseases particularly atopic dermatitis which is also applicable in
CC screening candidate compounds for remedies. Such method can be performed
CC in high throughput, at low cost. The present sequence is a differential
CC display PCR primer for the cDNA encoding the human acetyltransferase-like
CC protein 20-90-05

PT   New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic
PT   acids encoding the protein, useful for treating subjects having defects
PT   in KTOM1 which can manifest as cancer of the kidney, or as a disorder of
PT   e.g., liver or bone.
XX
PS   Example 2; Page 284; 418pp; English.
XX
CC   The invention relates to a novel isolated nucleic acid encoding human
CC   KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the
CC   invention has cytostatic activity. The nucleotide may have a use in gene
CC   therapy. The KTOM1 nucleic acids may be used to diagnose, treat or
CC   monitor a disease caused by altered expression of human KTOM1.
CC   Compositions comprising the nucleic acids, proteins or antibodies may be
CC   used to treat subjects having defects in KTOM1 which can manifest as
CC   cancer of the kidney, as well as a disorder of liver, bone marrow, brain,
CC   heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta
CC   function. The sequence represents a probe used in the invention to scan
CC   the nt 1-1001 portion of human KTOM1a (ABQ63232)

PS Example 1; Page 55; 74pp; Japanese.
XX
CC This invention relates to gene sequences that are differentially
CC expressed in eosinophils from patients with atopic dermatitis in the
CC increment stage as compared with those in the remission stage. These
CC sequences are used in a novel method for examining allergic diseases
CC comprising determining the expression levels of these genes and comparing
CC the expression level with that in the eosinophils of a healthy
CC individual. The method of the invention may have antiallergic or
CC dermatological activities. The method can be used to diagnose allergic
CC diseases particularly atopic dermatitis, and may also be used to screen
CC candidate compounds for remedies. The method of the invention can be
CC performed in high throughput, at low cost. The present sequence
CC represents the GT15g PCR primer used to amplify the differentially
CC amplified atopic dermatitis related cDNA sequences of the invention

PT Examining allergic diseases by differential display of genes showing
PT different expression particularly increase in remission stage in
PT eosinophils in patients.
XX
PS Example 1; Page 55; 74pp; Japanese.
XX
CC This invention relates to gene sequences that are differentially
CC expressed in eosinophils from patients with atopic dermatitis in the
CC increment stage as compared with those in the remission stage. These
CC sequences are used in a novel method for examining allergic diseases
CC comprising determining the expression levels of these genes and comparing
CC the expression level with that in the eosinophils of a healthy
CC individual. The method of the invention may have antiallergic or
CC dermatological activities. The method can be used to diagnose allergic
CC diseases particularly atopic dermatitis, and may also be used to screen
CC candidate compounds for remedies. The method of the invention can be
CC performed in high throughput, at low cost. The present sequence
CC represents the GT15g PCR primer used to amplify the differentially
CC amplified atopic dermatitis related cDNA sequences of the invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 11559; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

CC The present invention relates to murine oligonucleotides (ACC62754-

```
CC   ACC68806), which are associated with tumour suppression, tumour
CC   reversion, apoptosis and virus resistance. The oligonucleotides are
CC   useful as (1) as probes and primers for detecting, identifying,
CC   quantifying and/or amplifying nucleic acid, e.g. as one component of a
CC   gene chip; in vitro as (anti)sense reagents; and (2) for production of
CC   recombinant polypeptides. The oligonucleotides are useful for preparation
CC   of pharmaceuticals for prevention and/or treatment of viral diseases that
CC   are characterised by development of tumours or cell degeneration,
CC   specifically cancer but also Alzheimer's disease and schizophrenia

PT Recombinant vaccinia virus containing fusion HIB gag gene - for
PT production in host cells of gag protein for use as vaccine.
XX
PS Example 1; Page 64; 84pp; Japanese.
XX
CC AAV35388-V35414 are primers used in a method which results in a
CC recombinant vaccinia virus comprising of a gag gene from a retrovirus
CC such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope
CC region (30-300 bases in length) of a retroviral gene other than the gag
CC gene. The gag gene may be altered so as to produce a gag protein modified
CC from the natural sequence by the addition, deletion or substitution of at
CC least 1 amino acid residue. The fusion gene is inserted into a region of
CC a vaccinia virus not essential to its propagation, to give a recombinant
CC vaccinia virus vector which is used to transform a host cell (such as
CC HeLa, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon
CC culturing the host cell produces particulate structures containing the
CC fusion gag protein. The recombinant vaccinia virus or the fusion gag
CC protein particles may be used in the production of vaccines for
CC protecting against infection with retroviruses such as HIV

PT Functionalized nanocrystal carrying polynucleotide, used for detecting
PT target analyte, forms dendrimers with complementary nanocrystals to
PT amplify the fluorescent signal.
XX
PS Example 3; Page 68; 72pp; English.
XX
CC The present invention relates to functionalised nanocrystals for use in
CC nonisotopic detection systems for biomolecules e.g. nucleic acids,
CC proteins, lipids or drugs. The nanocrystals have polynucleotide strands
CC attached to their surfaces with one end of the polynucleotide extending
CC outwardly from the nanocrystal. The present sequence is one such
CC polynucleotide. These nanocrystals are used with a second series of
CC nanocrystals, which have polynucleotides complementary to the first
CC polynucleotides, so that the respective complementary strands hybridise
CC to each other and form a dendrimer. This dendrimer produces a signal
CC which can then be detected e.g. fluorescence. The present sequence is
CC composed mainly of Adenine bases. This sequence may therefore be used
CC with a polynucleotide composed mainly of Thymine bases (AAA58386)

PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT vasoconstriction.
XX
PS Disclosure; Page 70; 120pp; English.
XX
CC The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC -end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX55272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

PT SAG: Sensitive to Apoptosis Gene and related proteins, useful for
PT promoting cell growth and protecting cells against apoptosis.
XX
PS Example 1; Page 14; 84pp; English.
XX
CC This primer was used for reverse transcription of RNA isolated from mouse
CC tumour lines L-RT101 (epidermal tumour cell line) and H-Tx (spontaneously
CC transformed liver line). It was also used as the reverse primer in PCR
CC amplification of the resulting cDNA. Primers P1 and P2 (see AAX87333)
CC reproducibly detected differential expression of a gene between 1,10-
CC phenanthroline (OP)-treated and OP-nontreated L-RT101 and H-Tx cells. An

CC OP-inducible clone was used as a probe to isolate a full-length clone
CC (see AAX87313) corresponding to the mouse sensitive to apoptosis gene
CC (SAG). SAG is a redox-sensitive, haem-binding protein domain that
CC promotes cell growth, protects cells from apoptosis, scavenges oxygen
CC radicals and can be used for the reversion of a tumour phenotype

PT New antisense oligonucleotides useful for treating e.g. pulmonary
PT vasoconstruction, inflammation, allergies, asthma, hypertension,
PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
PS Disclosure; Page 539; 1343pp; English.
XX
CC The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

PT   Functionalized nanocrystal carrying polynucleotide, used for detecting
PT   target analyte, forms dendrimers with complementary nanocrystals to
PT   amplify the fluorescent signal.
XX
PS   Example 3; Page 69; 72pp; English.
XX
CC   The present invention relates to functionalised nanocrystals for use in
CC   nonisotopic detection systems for biomolecules e.g. nucleic acids,
CC   proteins, lipids or drugs. The nanocrystals have polynucleotide strands
CC   attached to their surfaces with one end of the polynucleotide extending
CC   outwardly from the nanocrystal. The present sequence is one such
CC   polynucleotide. These nanocrystals are used with a second series of
CC   nanocrystals, which have polynucleotides complementary to the first
CC   polynucleotides, so that the respective complementary strands hybridise
CC   to each other and form a dendrimer. This dendrimer produces a signal
CC   which can then be detected e.g. fluorescence. The present sequence is
CC   composed mainly of Thymine bases. This sequence may therefore be used
CC   with a polynucleotide composed mainly of Adenine bases (AAA58385)

PT Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 264; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide

CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC fragments and antisense oligonucleotides used in the exemplification of
CC the present invention

PT Determining nucleotide sequence signature, by obtaining optical values
PT for each nucleotide position in a group, adjusting them to get ratio of
PT final highest values near predetermined factor, generating base call.
XX
PS Disclosure; Page 19; 73pp; English.
XX
CC The specification describes a method for determining a nucleotide
CC sequence signature. The method comprises obtaining optical measurements
CC with values indicating each nucleotide in a group of nucleotide
CC positions, adjusting the values until the ratio of highest value in the
CC set to next highest values in the set is at least a predetermined factor,
CC and generating a base call for a position in the group based on results
CC after the adjustment of values. The method is used for determining a
CC signature of a nucleotide sequence, and for determining a nucleotide
CC sequence of a polynucleotide from a series of optical measurements. The
CC present sequence represents an adaptor, which is used in the course of
CC the invention

PT Probes for detecting target nucleotide sequence in sample, has sequence
PT that forms hairpin structure having a double-stranded segment and single-
PT stranded loop collectively forming region complementary to target
PT sequence.
XX
PS Example 2; Page 46; 72pp; English.
XX
CC The present sequence comprises a segment of a hairpin probe (see
CC ABA91524) used in an assay of Mycobacterium tuberculosis rifampicin
CC resistance. The present oligonucleotide was immobilised on a solid
CC support and hybridised with the oligonucleotide given in ABA91526 to
CC produce an immobilised hairpin probe. The hairpin probe is an example of
CC probes of the invention that form a hairpin structure with a double-
CC stranded stem segment and a single-stranded loop and which are capable of
CC both intramolecular and intermolecular hybridisation. The hairpin probes,
CC preferably immobilised, are used in nucleic acid hybridisations,
CC providing reduced background and improved specificity

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 11558; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Detecting point mutation in DNA strand, by hybridizing target DNA strand
PT   having mutation with test DNA strand to form duplex, contacting the
PT   duplex with RNase H and determining the cleavage of test strand by RNase
PT   H.
XX
PS   Example 2; Page 13; 26pp; English.
XX
CC   The invention relates to a novel method for detecting a point mutation in
CC   a DNA strand. The novel method comprises hybridising a target DNA strand
CC   containing or suspected of containing a point mutation with a test
CC   nucleic acid strand complementary to the DNA strand to form a target DNA
CC   strand/test nucleic acid strand duplex, contacting the duplex with an
CC   RNase H, and determining whether the ribonucleotide residues within the
CC   nucleotide sequence are cleaved by RNase H. The method is useful for
CC   detecting a point mutation in a DNA strand, where the point mutation to
CC   be detected is a single nucleotide polymorphism, preferably a
CC   polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian
CC   or human genome. The method is useful to detect any nucleic acids from
CC   any species of organisms such as Acintobacter, Bacillus, Candida,
CC   Enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses.
CC   This polynucleotide sequence represents an oligo relating to the mutation
CC   detecting method of the invention

PT Cloning of a new gene sequence expressed and inhibited during winter
PT dormancy of a tea tree top plumelet, comprises identification, cloning
PT and analysis of a new primer in the gene sequence.
XX
PS Example 3; Page 32; 66pp; Chinese.
XX
CC The present invention describes the cloning of a new gene sequence
CC expressed and inhibited during hibernation of the top plumelet of a
CC Camellia sinensis L.(O.) Kuntze tea tree. Also described is the
CC identification, cloning and analysis of a primer terminal in the gene
CC sequence expressed and inhibited during hibernation of the top plumelet
CC of the tea tree. The present sequence represents a PCR primer which is
CC used in an example from the present invention.

PT   New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT   vasoconstriction.
XX
PS   Disclosure; Page 70; 120pp; English.
XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Disclosure; Page 539; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 264; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   Detecting mutations in the BRCA1 and hMLH1 gene comprises subjecting
PT   amplification products to 2-dimensional gel electrophoresis to produce a
PT   characteristic spot pattern for a specific mutation in either the BRCA1
PT   or the hMLH1 gene.
XX
PS   Claim 6; Page 21; 57pp; English.
XX
CC   The invention relates to detecting mutations in the BRCA1 and hMLH1 gene
CC   comprising subjecting a set of amplification products to two-dimensional
CC   DNA electrophoresis (TGDS) to produce a characteristic spot pattern for a
CC   specific mutation in either the BRCA1 or the hMLH1 gene. Also included
CC   are test kits for enabling BRCA1 or hMLH1 gene testing comprising short
CC   PCR primers given in the specification, mixed in 20 mM of Tris-HCl, 50 mM
CC   KCl, 25 micro M of dNTP, and 5 % formamide. The method is useful for
CC   detecting mutations in the BRCA1 (breast and ovarian cancer
CC   susceptibility gene, a tumour suppressor gene) and hMLH1 gene (a DNA
CC   mismatch repair gene). The present sequence is a PCR primer specific to
CC   hMLH1 used in the method of the invention

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 11557; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.

PT   Efficient sequencing of long DNA by fragment walking - with simultaneous
PT   sequencing of restriction enzyme fragment and adjacent region of intact
PT   DNA, avoids the need for cloning and requires fewer primers.
XX
PS   Example 1; Page 23; 50pp; English.
XX
CC   A method for DNA analysis based on a complementary extension reaction
CC   using a DNA polymerase, comprises a combination of fragment walking and
CC   DNA sequencing. DNA fragments are formed by digestion of DNA with a
CC   restriction enzyme and the targeted DNA sequence can be determined
CC   directly from the digested DNA fragments. By exploring the overlapping
CC   sequence of the determined base sequence, the overall base sequence of a
CC   lengthy DNA can be determined with low redundancy without cloning or
CC   subcloning. In addition, the method can be done with commercially
CC   available universal primers or with fewer primers than required in
CC   existing methods. AAT73291-92 are primers used in determination of the
CC   pUC19 sequence. Primer extension was carried out using 16 primers

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 4361; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT vasoconstriction.
XX
PS Disclosure; Page 70; 120pp; English.
XX
CC The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC -end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX55272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary

PT   Determining common functional alleles in a population - useful in the
PT   diagnosis of disease associated with allelic heterogeneity.
XX
PS   Example 1; Page 24; 78pp; English.
XX
CC   The invention relates to methods of determining a functional allele
CC   profile of a gene in a population. Functional allele profiles comprise
CC   the commonly occurring alleles in a population, and the relative
CC   frequencies at which such alleles of a given gene occur. The methods are
CC   used to identify and determine the frequency of the functional alleles of
CC   genes which display extensive allelic heterogeneity, particularly those
CC   implicated in disease or conditions, such as the BRCA1 gene associated
CC   with breast cancer, CFTR associated with cystic fibrosis, dystrophin
CC   associated with Duchenne muscular dystrophy and Becker muscular
CC   dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods can
CC   also be employed for diseases where allelic and genetic heterogeneity
CC   exist, such as breast cancer, neurofibromatosis, and hereditary non-
CC   polyposis colorectal cancer. Identification of functional alleles is
CC   necessary for identification of mutations which may be implicated in the
CC   disease. Sequences AAX32001-172 represent primers for determining the
CC   functional allele profiles of various genes. The primers are specific for
CC   genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Disclosure; Page 539; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
```

CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

PT Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 264; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC fragments and antisense oligonucleotides used in the exemplification of
CC the present invention

PT   Recognition system, e.g. for identifying nucleic acids, comprises at
PT   least one recognition unit comprising a region with a defined structure
PT   adjacent to a region with a randomized structure.
XX
PS   Example; Fig 1; 8pp; German.
XX
CC   This invention describes a novel recognition system comprising at least 1
CC   recognition unit bound to a support, each recognition unit comprising a
CC   region A with a defined structure adjacent to a region B with a
CC   randomized structure. The recognition system is useful for screening,
CC   identifying, or characterizing at least 1 component of a sample,
CC   especially nucleic acids and/or proteins, and for screening for and/or
CC   identifying cellular or synthetic binding partners, preferably proteins,
CC   peptides, nucleic acids, chemical agents, preferably organic compounds,
CC   pharmaceuticals, plant protection agents, toxins, venoms, carcinogens,
CC   teratogens, herbicides, fungicides or pesticides
